## 9 V VHF and UHF mixer/oscillator for TV and VCR cable tuners

### TDA5630BT

#### FEATURES

- Balanced mixer with a common emitter input for band A (single input)
- 2-pin oscillator for band A
- Balanced mixer with a common base input for band C
- 3-pin oscillator for band C
- Local oscillator buffer output for external prescaler
- SAW filter preamplifier with a low output impedance to drive a SAW filter
- Band gap voltage stabilizer for oscillator stability
- Electronic band switch.

#### APPLICATIONS

- Cable tuners for TV and VCR (switched concept for VHF)
- Recommended RF bands for Europe:  
48.25 to 105.25 MHz, 112.25 to 294.25 MHz and 471.25 to 855.25 MHz
- Recommended RF bands for the USA:  
55.25 to 133.25 MHz, 139.25 to 361.25 MHz and 367.25 to 801.25 MHz.

#### GENERAL DESCRIPTION

The TDA5630BT is a monolithic integrated circuit that performs VHF and UHF mixer/oscillator functions in TV and VCR cable tuners. With a proper oscillator application and by using a switchable inductor to split the VHF band into two sub-bands, the full VHF/UHF TV bands can be covered. This low-power mixer/oscillator requires a power supply of 9 V and is available in a very small package.

The device gives the designer the capability to design an economical and physically small cable tuner.

The tuner development time can be drastically reduced by using this device.

Frequency bands are determined by the external tank circuit. They can be adapted to various standards.

#### QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_P$	supply voltage		–	9.0	–	V
$I_P$	supply current		–	48	–	mA
$f_{RF}$	frequency range (picture carrier)	RF input; band A; note 1	45	–	470	MHz
		RF input; band C; note 1	430	–	860	MHz
$G_V$	voltage gain	band A	–	25	–	dB
		band C	–	36	–	dB
NF	noise figure	band A	–	7.5	–	dB
		band C	–	9.0	–	dB
$V_o$	output voltage to get 1% cross modulation in channel	band A	–	118	–	dB $\mu$ V
		band C	–	120	–	dB $\mu$ V

#### Note

1. The limits are related to the tank circuits used in Fig.11 and the intermediate frequency. Frequency bands may be adjusted by the choice of external components.

## PINNING

SYMBOL	PIN	DESCRIPTION
CIN1	1	band C input 1
CIN2	2	band C input 2
RFGND	3	ground for RF inputs
AIN	4	band A input
V <sub>P</sub>	5	supply voltage
LOOUT1	6	local oscillator amplifier output 1
LOOUT2	7	local oscillator amplifier output 2
BS	8	band switch input
IFOUT1	9	IF amplifier output 1
IFOUT2	10	IF amplifier output 2
GND	11	ground (0 V)
COSCOC1	12	band C oscillator output collector 1
COSCOC2	13	band C oscillator output collector 2
AOSCOC	14	band A oscillator output collector
COSCIB	15	band C oscillator input base
AOSCIB	16	band A oscillator input base

## LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
V <sub>P</sub>	supply voltage	-0.3	+10.5	V
V <sub>SW</sub>	switching voltage	0	10.5	V
I <sub>O</sub>	output current of each pin referenced to ground	-	-10	mA
t <sub>s(max)</sub>	maximum short-circuit time (all pins)	-	10	s
T <sub>stg</sub>	IC storage temperature	-55	+150	°C
T <sub>amb</sub>	operating ambient temperature	-10	+70	°C
T <sub>j</sub>	junction temperature	-	150	°C

## THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	VALUE	UNIT
R <sub>th j-a</sub>	thermal resistance from junction to ambient in free air	115	K/W

## HANDLING

Human body model: the IC withstands 2000 V in accordance with the UZW-B0/FQ-A302 specification equivalent to the MIL-STD-883C category B (2000 V) (stress reference pins RFGND, GND and V<sub>P</sub> short-circuited together).

Machine model: the IC withstands 200 V in accordance with the UZW-B0/FQ-B302 specification (issue date: Nov 6<sup>th</sup>, 1990) (stress reference pins RFGND, GND and V<sub>P</sub> short-circuited together).

### Notes to the characteristics

- The RF frequency range is defined by the oscillator frequency range and the intermediate frequency.
- The gain is defined as the transducer gain (measured in Fig.11) plus the voltage transformation ratio of L6 to L7 (10 : 2, 15.4 dB including transformer loss).
- The input level causing 10 kHz frequency detuning at the LO output.  $f_{osc} = f_{RF} + 33.4 \text{ MHz}$ .
- All s-parameters are referred to a  $50 \Omega$  system.
- Limits are related to the tank circuits used in Fig.11. Frequency bands may be adjusted by the choice of external components.
- The frequency shift is defined as the change in oscillator frequency when the supply voltage varies from  $V_P = 9$  to  $8.1 \text{ V}$  or from  $V_P = 9$  to  $9.9 \text{ V}$ .
- The frequency drift is defined as the change in oscillator frequency when the ambient temperature varies from  $T_{amb} = 25$  to  $0 \text{ }^\circ\text{C}$  or from  $25$  to  $50 \text{ }^\circ\text{C}$ . With no compensation, all capacitors are NP0.
- Switch on drift with no compensation is defined as the change of oscillator frequency between 5 s and 15 min after switch on. All capacitors are NP0.
- Switch on drift with compensation is defined as the change of oscillator frequency between 5 s and 15 min after switch on. C5 to C11 are N750; C1, C2 and C4 are N470.
- The values have been corrected for hybrid and cable losses. The symmetrical output impedance of the hybrid is  $100 \Omega$ .
- Measured with RF input voltage:
  - RF voltage =  $120 \text{ dB}\mu\text{V}$  at  $f_{RF} < 180 \text{ MHz}$ .
  - RF voltage =  $107.5 \text{ dB}\mu\text{V}$  at  $180 \text{ MHz} < f_{RF} < 225 \text{ MHz}$ .
  - RF voltage =  $97 \text{ dB}\mu\text{V}$  at  $225 \text{ MHz} < f_{RF} < 860 \text{ MHz}$ .

TDA5630BT

(1)  $NF = NF_{meas} - \text{loss (input circuit) dB}$ .

Fig.5 Noise figure measurement in band A.

$V_{meas} = V_o - 15.4 \text{ dB}$  (transformer ratio  $N1/N2 = 5$  and transformer loss).

Wanted output signal at  $f_{RFW} = 300 \text{ MHz}$ :  $V_{ow} = 104 \text{ dB}\mu\text{V}$  ( $V_{meas} = 88.6 \text{ dB}\mu\text{V}$ ).

We measure the level of the unwanted signal  $V_{ou}$  causing 0.3% AM modulation in the wanted output signal;  $f_{RFU} = 305.5 \text{ MHz}$ .

$V_{ou} = V_{meas} + 15.4 \text{ dB}$ .

$f_{osc} = 338.9 \text{ MHz}$ .

Filter characteristics:  $f_c = 38.9 \text{ MHz}$ ;  $f_{-3\text{dB BW}} = 1.2 \text{ MHz}$ ;  $f_{-30\text{dB BW}} = 2.64 \text{ MHz}$ .

Fig.6 Cross modulation measurement in band A.

# 9 V VHF and UHF mixer/oscillator for TV and VCR cable tuners

## TDA5630BT

$V_{meas} = V_o - 15.4 \text{ dB}$  (transformer ratio  $N1/N2 = 5$  and transformer loss).  
 Wanted output signal at  $f_{RFW}$ :  $V_{ow} = 108 \text{ dB}\mu\text{V}$ ,  $V_{meas} = 92.6 \text{ dB}\mu\text{V}$ .  
 We measure the level of the unwanted output signal  $V_{ou}$  causing 0.3% AM modulation in the wanted output signal.  
 $V_{ou} = V_{meas} + 15.4 \text{ dB}$ .  
 $f_{RFU} = f_{RFW} + 5.5 \text{ MHz}$ ;  $f_{osc} = f_{RF} + 38.9 \text{ MHz}$ .  
 Filter characteristics:  $f_c = 38.9 \text{ MHz}$ ;  $f_{-3\text{dB BW}} = 1.2 \text{ MHz}$ ;  $f_{-30\text{dB BW}} = 2.64 \text{ MHz}$ .

Fig.9 Cross modulation measurement in band C.

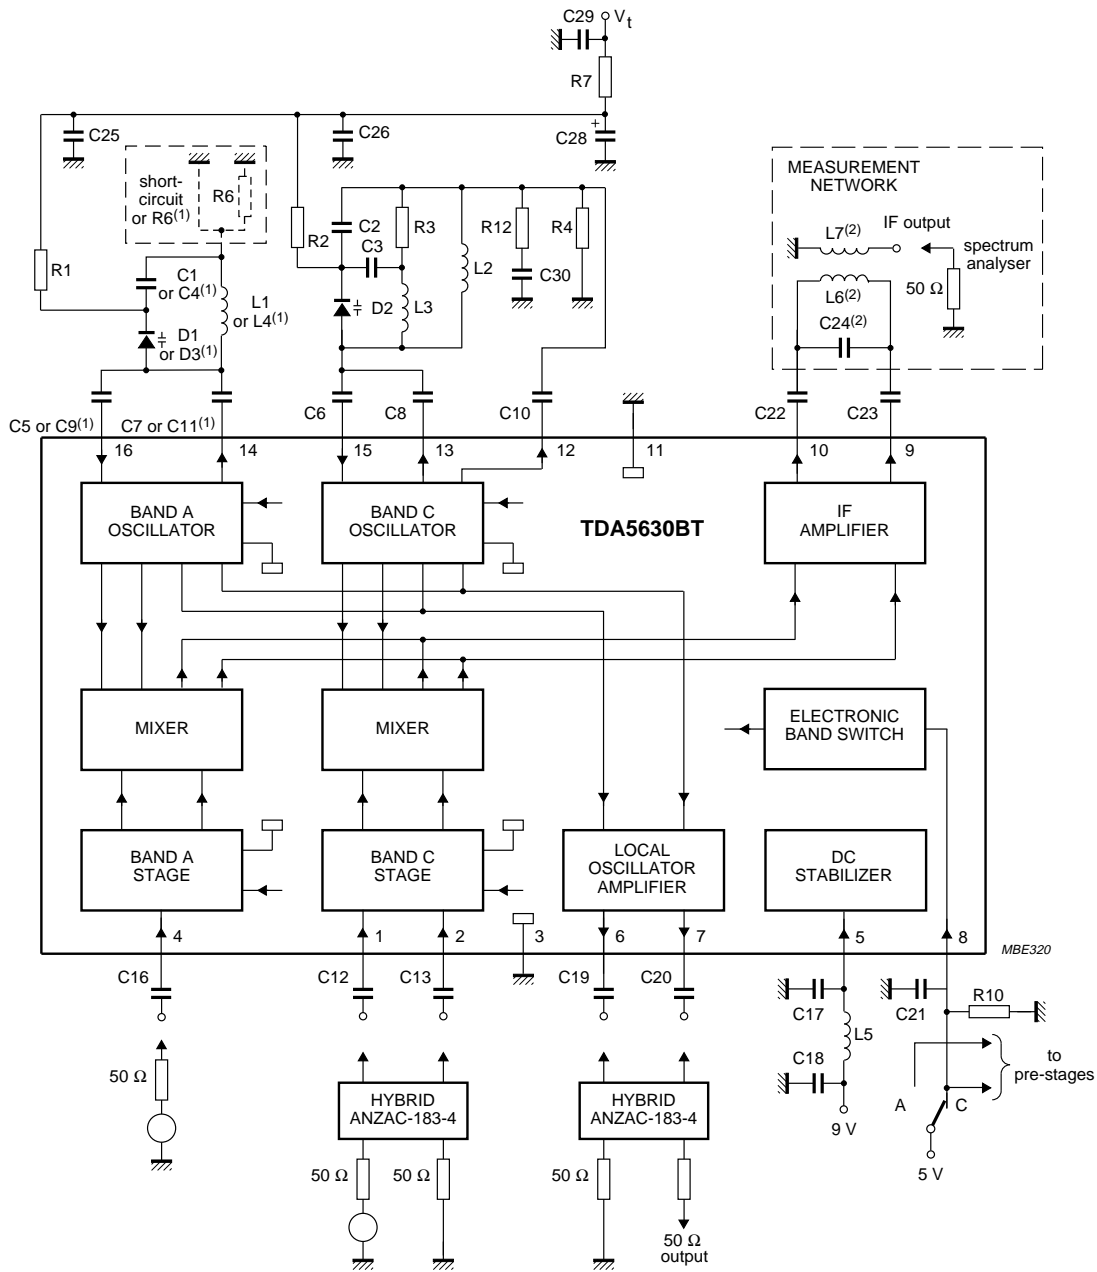

Loss of the hybrid: 1 dB.  
 $f_{RFW} = 781 \text{ MHz}$ . This wanted signal is not used during the measurement.  
 $f_{osc} = 819.9 \text{ MHz}$ .  
 $f_{RFU} = 820 \text{ MHz} = f_{RFW} + 5 \times 8 \text{ MHz} - 1 \text{ MHz}$ .  
 We measure the level of the unwanted signal  $V_{iu}$  causing FM sidebands 30 dB below the oscillator carrier at the LO output.  
 $V_{iu} = V_{meas} - \text{loss of the hybrid}$ .

Fig.10 N + 5 - 1 MHz pulling measurement in band C.

9 V VHF and UHF mixer/oscillator for TV  
and VCR cable tuners

TDA5630BT

- (1) There are two applications for the band A oscillator:
  - from 80 to 216 MHz: the band A tank circuit is built with C1, D1, L1, C5 and C7. R6 is a short-circuit.
  - from 180 to 506 MHz: the band A tank circuit is built with R6, C4, D3, L4, C9 and C11.
- (2) L6, L7 and C24 are only required for measurement purposes; they are not used in a tuner.

## 9 V VHF and UHF mixer/oscillator for TV and VCR cable tuners

---

TDA5630BT

### SOLDERING

#### Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "*IC Package Databook*" (order code 9398 652 90011).

#### Reflow soldering

Reflow soldering techniques are suitable for all SO packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

#### Wave soldering

Wave soldering techniques can be used for all SO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

#### Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

**TDA5630BT****DEFINITIONS**

<b>Data sheet status</b>	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

**LIFE SUPPORT APPLICATIONS**

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
