3 Watt DO-41 Surmetic™ 30 Zener Voltage Regulators

This is a complete series of 3 Watt Zener diodes with limits and excellent operating characteristics that reflect the superior capabilities of silicon—oxide passivated junctions. All this in an axial—lead, transfer—molded plastic package that offers protection in all common environmental conditions.

Specification Features:

- Zener Voltage Range 3.3 V to 200 V
- ESD Rating of Class 3 (>16 KV) per Human Body Model
- Surge Rating of 98 W @ 1 ms
- Maximum Limits Guaranteed on up to Six Electrical Parameters
- Package No Larger than the Conventional 1 Watt Package

Mechanical Characteristics:

CASE: Void free, transfer-molded, thermosetting plastic

FINISH: All external surfaces are corrosion resistant and leads are

readily solderable

MAXIMUM LEAD TEMPERATURE FOR SOLDERING PURPOSES:

230°C, 1/16" from the case for 10 seconds **POLARITY:** Cathode indicated by polarity band

MOUNTING POSITION: Any

MAXIMUM RATINGS

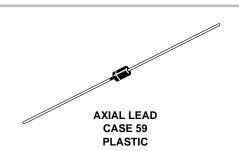

Rating	Symbol	Value	Unit
Max. Steady State Power Dissipation @ T _L = 75°C, Lead Length = 3/8"	P _D	3	W
Derate above 75°C		24	mW/°C
Steady State Power Dissipation @ T _A = 50°C	P _D	1	W
Derate above 50°C		6.67	mW/°C
Operating and Storage Temperature Range	T _J , T _{stg}	–65 to +200	°C

ORDERING INFORMATION

Device	Package	Shipping
1N59xxB	Axial Lead	2000 Units/Box
1N59xxBRL	Axial Lead	6000/Tape & Reel
1N59xxBRR1 [†]	Axial Lead	2000/Tape & Reel
1N59xxBRR2 [‡]	Axial Lead	2000/Tape & Reel

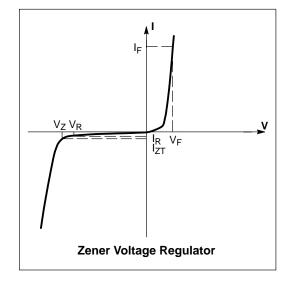

- † Polarity band **up** with cathode lead off first
- [‡] Polarity band **down** with cathode lead off first

Devices listed in *bold, italic* are ON Semiconductor **Preferred** devices. **Preferred** devices are recommended choices for future use and best overall value.

ELECTRICAL CHARACTERISTICS

 $(T_L = 30^{\circ}C \text{ unless otherwise noted,}$ $V_F = 1.5 \text{ V Max } @ I_F = 200 \text{ mAdc for all types)}$

Symbol	Parameter	
VZ	Reverse Zener Voltage @ I _{ZT}	
I _{ZT}	Reverse Current	
Z _{ZT}	Maximum Zener Impedance @ I _{ZT}	
I _{ZK}	Reverse Current	
Z _{ZK}	Maximum Zener Impedance @ I _{ZK}	
I _R	Reverse Leakage Current @ V _R	
V_{R}	Breakdown Voltage	
I _F	Forward Current	
V _F	Forward Voltage @ I _F	
I _{ZM}	Maximum DC Zener Current

^{1.} TOLERANCE AND TYPE NUMBER DESIGNATION

Tolerance designation – device tolerance of ±5% are indicated by a "B" suffix.

2. ZENER VOLTAGE (V₂) MEASUREMENT

ON Semiconductor guarantees the zener voltage when measured at 90 seconds while maintaining the lead temperature (T_L) at 30°C ±1°C, 3/8" from the diode body.

3. ZENER IMPEDANCE (Z₂) DERIVATION

The report improduces individed from 60 seconds AC valters which results when an AC surrent begins on recovering an armound a guarantee 10% of the

The zener impedance is derived from 60 seconds AC voltage, which results when an AC current having an rms value equal to 10% of the DC zener current (I_{ZT} or I_{ZK}) is superimposed on I_{ZT} or I_{ZK} .

APPLICATION NOTE

Since the actual voltage available from a given zener diode is temperature dependent, it is necessary to determine junction temperature under any set of operating conditions in order to calculate its value. The following procedure is recommended:

Lead Temperature, T_L, should be determined from:

$$T_L = \theta_{LA} P_D + T_A$$

 θ_{LA} is the lead-to-ambient thermal resistance (°C/W) and P_D is the power dissipation. The value for θ_{LA} will vary and depends on the device mounting method. θ_{LA} is generally 30–40°C/W for the various clips and tie points in common use and for printed circuit board wiring.

The temperature of the lead can also be measured using a thermocouple placed on the lead as close as possible to the tie point. The thermal mass connected to the tie point is normally large enough so that it will not significantly respond to heat surges generated in the diode as a result of pulsed operation once steady-state conditions are achieved. Using the measured value of T_L , the junction temperature may be determined by:

$$T_{,J} = T_{I} + \Delta T_{,JI}$$

 ΔT_{JL} is the increase in junction temperature above the lead temperature and may be found from Figure 2 for a train of power pulses (L = 3/8 inch) or from Figure 10 for dc power.

$$\Delta T_{JL} = \theta_{JL} P_D$$

For worst-case design, using expected limits of I_Z , limits of P_D and the extremes of T_J (ΔT_J) may be estimated. Changes in voltage, V_Z , can then be found from:

$$\Delta V = \theta_{VZ} \Delta T_{J}$$

 θ_{VZ} , the zener voltage temperature coefficient, is found from Figures 5 and 6.

Under high power-pulse operation, the zener voltage will vary with time and may also be affected significantly by the zener resistance. For best regulation, keep current excursions as low as possible.

Data of Figure 2 should not be used to compute surge capability. Surge limitations are given in Figure 3. They are lower than would be expected by considering only junction temperature, as current crowding effects cause temperatures to be extremely high in small spots resulting in device degradation should the limits of Figure 3 be exceeded.
