

DESCRIPTION

The HY62256A-I is a high-speed, low power and 32,768 x 8-bits CMOS static RAM fabricated using Hyundai's high performance twin tub CMOS process technology. This high reliability process coupled with innovative circuit design techniques, yields maximum access time of 55ns. The HY62256A-I has a data retention mode that guarantees data to remain valid at a minimum power supply voltage of 2.0 volt. Using CMOS technology, supply voltages from 2.0 to 5.5 volt have little effect on supply current in data retention mode. Reducing the supply voltage to minimize current drain is unnecessary with the HY62256A-I Series. -40°C to 85°C operating temperature range is suitable for industrial use.

TIMING DIAGRAM

READ CYCLE 1

Note (READ CYCLE):

1. t_{CHZ} and t_{OH} are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
2. At any given temperature and voltage condition, t_{CHZ} max. is less than t_{CLZ} min. both for a given device and from device to device.
3. $\overline{WE}$ is high for read cycle.

READ CYCLE 2

Note(READ CYCLE):

1. $\overline{WE}$ is high for read cycle.
2. Device is continuously selected $\overline{CS}=V_{IL}$.
3. $\overline{OE}=V_{IL}$.

WRITE CYCLE 1 ($\overline{OE}$ Clocked))

WRITE CYCLE 2 ($\overline{OE}$ Low Fixed)

Note (WRITE CYCLE):

1. A write occurs during the overlap of a low $\overline{CS}$ and a low $\overline{WE}$. A write begins at the latest transition among $\overline{CS}$ going low, and $\overline{WE}$ going low. A write ends at the earliest transition among $\overline{CS}$ going high $\overline{WE}$ going high. t_{wp} is measured from the beginning of write to the end of write.
2. t_{cw} is measured from the later of $\overline{CS}$ going low to end of write.
3. t_{as} is measured from the address valid to the beginning of write.
4. t_{wr} is measured from the end of write to the address change. t_{wr} applied in case a write ends as $\overline{CS}$, or $\overline{WE}$ going high.
5. If $\overline{OE}$ and $\overline{WE}$ are in the read mode during this period, the I/O pins are in the output low-Z state, inputs of opposite phase of the output must not be applied because bus contention can occur.
6. If $\overline{CS}$ goes low simultaneously with $\overline{WE}$ going low or after $\overline{WE}$ going low, the outputs remain in high impedance state.
7. D_{OUT} is the same phase of latest written data in this write cycle.
8. D_{OUT} is the read data of the new address.
