Description

The CY29940 is a low-voltage 200-MHz clock distribution buffer with the capability to select either a differential LVPECL or a LVCMOS/LVTTL compatible input clock. The two clock sources can be used to provide for a test clock as well as the primary system clock. All other control inputs are LVCMOS/LVTTL compatible. The eighteen outputs are 2.5 V or 3.3 V LVCMOS/LVTTL compatible and can drive 50 Ω series or parallel terminated transmission lines. For series terminated transmission lines, each output can drive one or two traces giving the device an effective fanout of 1:36. Low output-to-output skews make the CY29940 an ideal clock distribution buffer for nested clock trees in the most demanding of synchronous systems.

Maximum Ratings^[2]

Maximum Input Voltage Relative to V_{SS}	$V_{SS} - 0.3 V$
Maximum Input Voltage Relative to V_{DD}	$V_{DD} + 0.3 V$
Storage Temperature	$-65^{\circ}C$ to $+150^{\circ}C$
Operating Temperature.....	$-40^{\circ}C$ to $+85^{\circ}C$
Maximum ESD Protection	2 kV
Maximum Power Supply.....	5.5 V
Maximum Input Current.....	± 20 mA

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation, V_{in} and V_{out} should be constrained to the range:

$$V_{SS} < (V_{in} \text{ or } V_{out}) < V_{DD}$$

Unused inputs must always be tied to an appropriate logic voltage level (either V_{SS} or V_{DD}).

Notes

- Multiple Supplies:** The Voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is not required.
- Inputs have pull-up/pull-down resistors that effect input current.
- The VCMR is the difference from the most positive side of the differential input signal. Normal operation is obtained when the "High" input is within the VCMR range and the input lies within the VPP specification. Driving series or parallel terminated 50 Ω (or 50 Ω to $V_{DD}/2$) transmission lines
- Outputs driving 50 Ω transmission lines.
- See [Figure 1 on page 5](#) and [Figure 2 on page 5](#).
- 50% input duty cycle.
