

Features

February 2003

- 2,048 × 512 and 512 × 512 switching among backplane and local streams
- Rate conversion between 2.048, 4.096 and 8.192Mb/s
- Optional sub-rate switch configuration for 2.048 Mb/s streams
- Per-channel variable or constant throughput delay
- Compatible to HMVIP and H.100 specifications
- Automatic frame offset delay measurement
- Per-stream frame delay offset programming
- Per-channel message mode
- Per-channel direction control
- Per-channel high impedance output control
- Non-multiplexed microprocessor interface
- Connection memory block programming
- 3.3V local I/O with 5V tolerant inputs and TTL-compatible outputs
- IEEE-1149.1 (JTAG) Test Port

Description

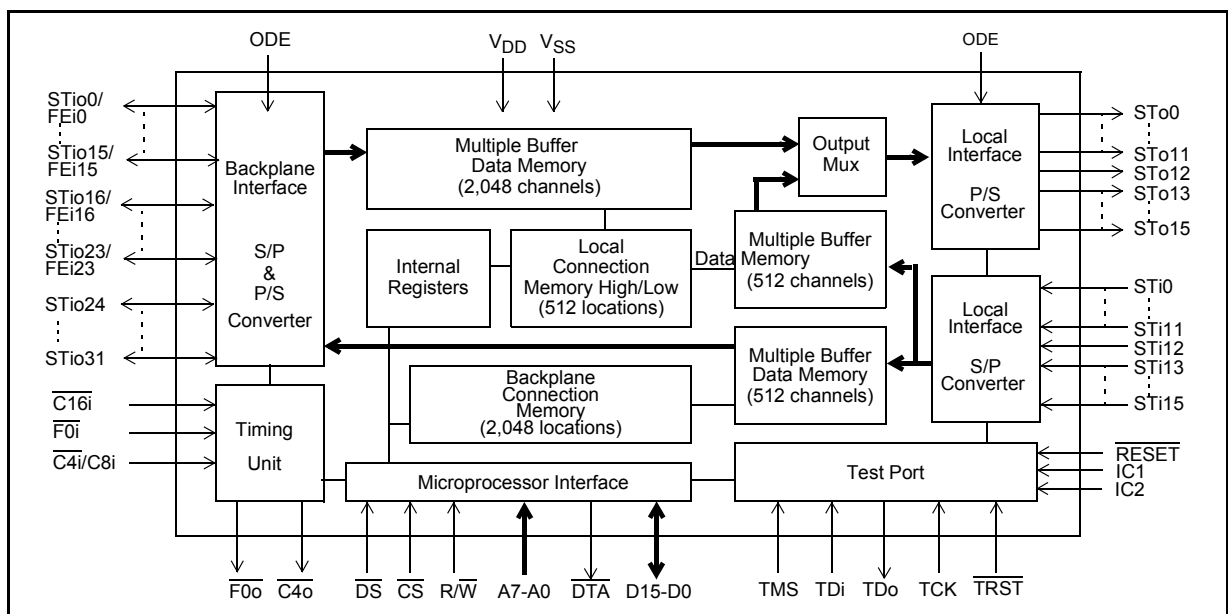

The MT90863 Rate Conversion Switch provides switching capacities of 2,048 × 512 channels between backplane and local streams, and 512 × 512 channels for local streams. The connected serial inputs and outputs may have 32, 64 and 128 64kb/s channels per frame with data rates of 2.048Mb/s, 4.096Mb/s and 8.192Mb/s respectively.

The MT90863 also offers a sub-rate switching configuration which allows 2-bit wide 16kb/s data channels to be switched within the device.

The device has features (such as: message mode; input and output offset delay; direction control; and, high impedance output control) that are programmable on per-stream or per-channel basis.

Applications

- Medium and large switching platforms
- CTI application
- Voice/data multiplexer
- Support ST-BUS, HMVIP and H.100 interfaces

| 89 | D12 | $\overline{C16i}$ | Master Clock (5V Tolerant Input): Serial clock for shifting data in/out on the serial streams. This pin accepts a 16.384 MHz clock. |
| 91 | D11 | $\overline{F0i}$ | Master Frame Pulse (5V Tolerant Input): In ST-BUS mode, this input accepts a 61ns wide negative frame pulse. In CT Bus mode, it accepts a 122ns wide negative frame pulse. In HMVIP mode, it accepts a 244ns wide negative frame pulse. |
| 92 | B13 | $\overline{C4i/C8i}$ | HMVIP/CT Bus Clock (5V Tolerant Input): When HMVIP mode is enabled, this pin accepts a 4.096MHz clock for HMVIP frame pulse alignment. When CT Bus mode is enabled, it accepts a 8.192MHz clock for CT frame pulse alignment. |
| 94 | A13 | $\overline{F0o}$ | Frame Pulse (5V Tolerant Output): A 244ns wide negative frame pulse that is phase locked to the master frame pulse ($\overline{F0i}$). |
| 95 | C12 | $\overline{C4o}$ | C4 Clock (5V Tolerant Output): A 4.096MHz clock that is phase locked to the master clock ($\overline{C16i}$). |
| 98-105,108-115 | C11, B12, B11, A12, A11, B10, A10, B9, A9, C8, B8, A8, C7, B7, A7, A6, | STio0 - 15 FEi0 - 15 | Serial Input Streams 0 to 15 / Frame Evaluation Inputs 0 to 15 (5V Tolerant I/O). In 2Mb/s and HMVIP modes, these pins accept serial TDM data streams at 2.048 Mb/s with 32 channels per stream. In 4Mb/s or 8Mb/s mode, these pins accept serial TDM data streams at 4.096 or 8.192 Mb/s with 64 or 128 channels per stream respectively. In Frame Evaluation Mode (FEM), they are frame evaluation inputs. |
| 118-125 | B6, A5, B5, A4, B4, C4, A3, B3 | STio16 - 23 FEi16 - 23 | Serial Input Streams 16 to 23 (5V Tolerant I/O). In 2Mb/s or 4Mb/s mode, these pins accept serial TDM data streams at 2.048 or 4.096 Mb/s with 32 or 64 channels per stream respectively. In HMVIP mode, these pins have a data rate of 8.192Mb/s with 128 channels per stream. In Frame Evaluation Mode (FEM), they are frame evaluation inputs. |
| 128,1-7 | A2, B2, A1, C3, C2, B1, D3, D2 | STio24 - 31 | Serial Input Streams 24 to 31 (5V Tolerant I/O). These pins are only used for 2Mb/s or 4Mb/s mode. They accept serial TDM data streams at 2.048 or 4.096 Mb/s with 32 or 64 channels per stream respectively. |
| 9 | C1 | TMS | Test Mode Select (3.3V Input with internal pull-up): JTAG signal that controls the state transitions of the TAP controller. |
| 10 | D1 | TDi | Test Serial Data In (3.3V Input with internal pull-up): JTAG serial test instructions and data are shifted in on this pin. |

Pin Description (continued)

| 128 MQFP Pin# | 144 BGA Pin# | Name | Description |
|---------------|---|---------------------------|---|
| 11 | E2 | TDo | Test Serial Data Out (3.3V Output): JTAG serial data is output on this pin on the falling edge of TCK. This pin is held in a high impedance state when JTAG scan is not enabled. |
| 12 | E1 | TCK | Test Clock (5V Tolerant Input): Provides the clock to the JTAG test logic. |
| 13 | F2 | $\overline{\text{TRST}}$ | Test Reset (3.3 V Input with internal pull-up): Asynchronously initializes the JTAG TAP controller by putting it in the Test-Logic-Reset state. This pin should be pulsed low on power-up, or held low continuously, to ensure that the MT90863 is in the normal operation mode. |
| 14 | F3 | IC1 | Internal Connection 1 (3.3V Input with internal pull-down): Connect to V_{SS} for normal operation. |
| 15 | F1 | $\overline{\text{RESET}}$ | Device Reset (5V Tolerant Input): This input (active LOW) puts the MT90863 in its reset state. This clears the device's internal counters and registers. |
| 16 | G3 | IC2 | Internal Connection 2 (3.3V Input): Connect to V_{SS} for normal operation. |
| 18-25 | G1, H1, H2, H3, J2, J1, J3, K1 | A0 - A7 | Address 0 - 7 (5V Tolerant Input): These lines provide the A0 to A7 address lines to the internal memories. |
| 26 | K2 | $\overline{\text{DS}}$ | Data Strobe (5V Tolerant Input): This active low input works in conjunction with $\overline{\text{CS}}$ to enable the read and write operations. |
| 27 | L2 | $\overline{\text{R/W}}$ | Read/Write (5V Tolerant Input): This input controls the direction of the data bus lines (D0-D15) during a microprocessor access. |
| 28 | L1 | $\overline{\text{CS}}$ | Chip Select (5V Tolerant Input): Active low input used by a microprocessor to activate the microprocessor port. |
| 31-38, 40-47 | M1, N1, M2, N2, M3, L4, N3, L5, M4, N4, M5, L6, M6, N5, N6, M7, | D0 - 7, D8 - D15 | Data Bus 0 -15 (5V Tolerant I/O): These pins form the 16-bit data bus of the microprocessor port. |
| 48 | N7 | $\overline{\text{DTA}}$ | Data Transfer Acknowledgment (5V Tolerant Three-state Output): This active low output indicates that a data bus transfer is complete. A pull-up resistor is required to hold a HIGH level when the pin is tri-stated. |
| 51-54 | N8, M8, N9, N10 | STi0 - 3 | Serial Input Streams 0 to 3 (5V Tolerant Inputs): In 2Mb/s or Subrate Switching mode, these inputs accept data rates of 2.048 Mb/s with 32 channels per stream. In 8Mb/s mode, these inputs accept data rates of 8.192 Mb/s with 128 channels per stream. |
| 55-62 | M9, N11, L9, M10, L10, N12, M11, N13 | STi4 - 11 | Serial Input Streams 4 to 11 (5V Tolerant Inputs): In 2Mb/s or Sub-rate Switching mode, these inputs accept data rates of 2.048Mb/s with 32 channels per stream. |

Pin Description (continued)

| 128 MQFP Pin# | 144 BGA Pin# | Name | Description |
|---------------|--|---------------------|---|
| 63 | L11 | STi12 | Serial Input Streams 12 (5V Tolerant Input): In 2Mb/s mode, this input accepts data rate of 2.048Mb/s with 32 channels per stream respectively. In Sub-rate Switching mode, this pin accepts 2.048Mb/s with 128 channels per stream for Sub-rate switching application. |
| 64-66 | M12, M13, L12 | STi13 - 15 | Serial Input Streams 13 to 15 (5V Tolerant Inputs): In 2Mb/s mode, these inputs accept a data rate of 2.048Mb/s with 32 channels per stream. |
| 69 | L13 | ODE | Output Drive Enable (5V Tolerant Input): This is the output enable control for the STo0 to STo15 serial outputs and STio0 to STio31 serial bidirectional outputs. |
| 70-73 | K13, K12, J13, J12 | STo0 - 3 | Serial Output Streams 0 to 3 (5V Tolerant Three-state Outputs): In 2Mb/s or Sub-rate Switching mode, these outputs have data rates of 2.048 Mb/s with 32 channels per stream respectively. In 8Mb/s mode, these outputs have data rates of 8.192 Mb/s with 128 channels per stream |
| 74-77, 80-83 | H11, H13, H12, G13, G12, F13, F12, E13 | STo4 - 7, STo8 - 11 | Serial Output Streams 4 to 11 (5V Tolerant Three-state Outputs): In 2Mb/s or Sub-rate Switching mode, these outputs have data rates of 2.048Mb/s with 32 channels per stream |
| 84 | E12 | STo12 | Serial Output Streams 12 (5V Tolerant Three-state Output): In 2Mb/s mode, this output has data rate of 2.048Mb/s with 32 channels per stream. In Sub-rate Switching mode, this pin has data rate of 2.048Mb/s with 128 channels per stream for Sub-rate switching application. |
| 85-87 | D13, E11, C13 | STo13 - 15 | Serial Output Streams 13 to 15 (5V Tolerant Three-state Outputs): In 2Mb/s mode, these outputs have a data rate of 2.048Mb/s with 32 channels per stream. |

1.0 Device Overview

The Rate conversion Switch (MT90863) can switch up to $2,048 \times 512$ channels while also providing a rate conversion capability. It is designed to switch 64 kb/s PCM or $N \times 64$ kb/s data between the backplane and local interfaces. When the device is in the sub-rate switching mode, 2-bit wide 16 kb/s data channels can be switched within the device. The device maintains frame integrity in data applications and minimum throughput delay for voice application on a per channel basis.

The backplane interface can operate at 2.048, 4.096 or 8.192 Mb/s, arranged in 125 μ s wide frames that contain 32, 64 or 128 channels, respectively. A built-in rate conversion circuit allows users to interface between backplane interface and the local interface which operates at 2.048 Mb/s or 8.192 Mb/s.

By using Mitel's message mode capability, the microprocessor can access input and output time-slots on a per channel basis. This feature is useful for transferring control and status information for external circuits or other ST-Bus devices.

The frame offset calibration function allows users to measure the frame offset delay for streams STio0 to STio23. The offset calibration is activated by a frame evaluation bit in the frame evaluation register. The evaluation result is stored in the frame evaluation registers and can be used to program the input offset delay for individual streams using internal frame input offset registers.

2.0 Functional Description

A functional Block Diagram of the MT90863 is shown in Figure 1. One end of the MT90863 is used to interface with backplane applications, such as HMVIP or H.100 environments, while the other end supports the local switching environments.

2.1 Frame Alignment Timing

The Device Mode Selection (DMS) register allows users to select three different frame alignment timing modes. In ST-BUS modes, the master clock ($\overline{C16i}$) is always at 16.384 MHz. The frame pulse ($\overline{F0i}$) input accepts a negative frame pulse at 8kHz. The frame pulse goes low at the frame boundary for 61ns. The frame pulse output $\overline{F0o}$ provides a 244ns wide negative frame pulse and the $\overline{C4o}$ output provides a 4.094MHz clock. These two signals are used to support local switching applications. See Figure 4 for the ST-BUS timings.

In CT Bus mode, the $\overline{C4i}/C8i$ pin accepts 8.192MHz clock for the CT Bus frame pulse alignment. The $\overline{F0i}$ is the CT bus frame pulse input. The CT frame pulse goes low at the frame boundary for 122ns. See Figure 5 for the CT Bus timing.

In HMVIP mode, the $\overline{C4i}/C8i$ pin accepts 4.096MHz clock for the HMVIP frame pulse alignment. The $\overline{F0i}$ is the HMVIP frame pulse input. The HMVIP frame pulse goes low at the frame boundary for 244ns. See Figure 6 for the HMVIP timing.

Table 1 - describes the input timing requirements for ST-BUS, CT Bus and HMVIP modes.

3.0 Switching Configuration

The device has four operation modes for the backplane interface and three operation modes for the local interface. These modes can be programmed via the Device Mode Selection (DMS) register. Mode selections between the backplane and local interfaces are independent. See Table 2 and Table 3 for the selection of various operation modes via the programming of the DMS register.

3.1 Backplane Interface

The backplane interface can be programmed to accept data streams of 2Mb/s, 4Mb/s or 8Mb/s. When 2Mb/s mode is enabled, STio0 to STio31 have a data rate of 2.048Mb/s. When 4Mb/s mode is enabled, STio0 to STio31 have a data rate of 4.096Mb/s. When 8Mb/s mode is enabled, STio0 to STio15 have a data rate of 8.192Mb/s. When HMVIP mode is enabled, STio0 to STio15 have a data rate of 2.048Mb/s and STio16 to STio23 have a data rate of 8.192Mb/s. Table 2 describes the data rates and mode selection for the backplane interface.

Figure 4 - ST-BUS Timing for 2, 4 and 8 Mb/s Data Streams

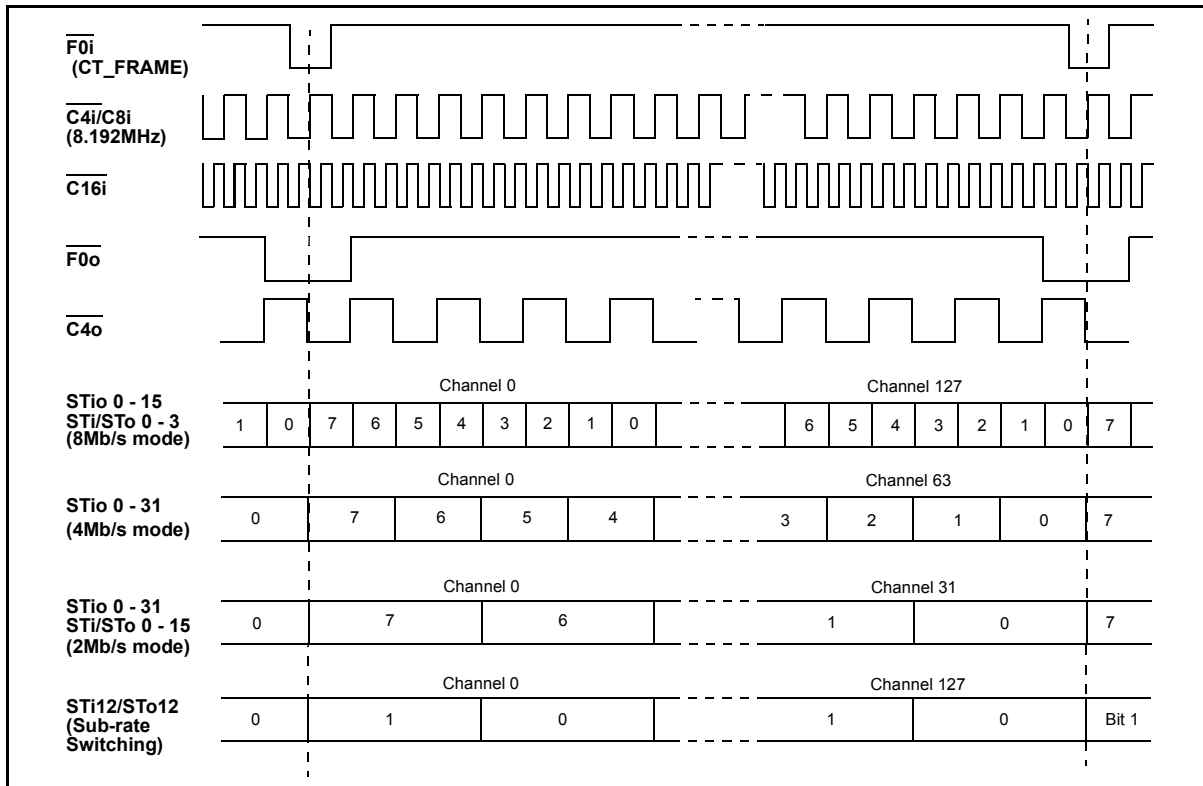

Figure 5 - CT Bus Mode Timing for 2, 4 and 8 Mb/s Data Streams

Figure 6 - HMVIP Mode Timing for 2 and 8 Mb/s Data Streams

3.2 Local Interface

Three operation modes, 2Mb/s, 8Mb/s and Sub-rate Switching mode, can be selected for the local interface. When 2Mb/s mode is selected, STi0 to STi15 and STo0 to STo15 have a 2.048Mb/s data rate. When 8Mb/s mode is selected, STi0 to STi3 and STo0 to STo3 have an 8.192Mb/s data rate. When Sub-rate Switching mode is selected, STi0 to STi11 and STo0 to STo11 have 2.048Mb/s data with 64kb/s data channels and STi12 and STo12 have a 2.048Mb/s data rate with 16kb/s data channels. Table 3 describes the data rates and mode selection for the local interface.

3.3 Input Frame Offset Selection

Input frame offset selection allows the channel alignment of individual backplane input streams, that operate at 8.192Mb/s (STi0-23), to be shifted against the input frame pulse ($\overline{F0i}$). This feature compensates for the variable path delays caused by serial backplanes of variable length. Such delays can occur in large centralized and distributed switching systems.

Each backplane input stream can have its own delay offset value by programming the input delay offset registers (DOS0 to DOS5). Possible adjustment can range up to +4 master clock ($\overline{C16i}$) periods forward with resolution of half master clock period. See Table 10 and Table 11, and Figure 9, Figure 9 - for frame input delay offset programming.

3.4 Output Advance Offset Selection

The MT90863 allows users to advance individual backplane output streams which operate at 8.192Mb/s (STi0-23) by half a master clock ($\overline{C16i}$) cycle. This feature is useful in compensating for variable output delays caused by various output loading conditions. The frame output offset registers (FOR0 & FOR1) control the output offset delays for each backplane output stream via the OFn bit programming. Table 12 and Figure 10 detail frame output offset programming.

3.5 Serial Input Frame Alignment Evaluation

The MT90863 provides the frame evaluation inputs, FEi0 to FEi23, to determine different data input delays with respect to the frame pulse $\overline{F0i}$. By using the frame evaluation input select bits (FE0 to FE4) of the frame alignment register (FAR), users can select one of the twenty-four frame evaluation inputs for the frame alignment measurement.

A measurement cycle is started by setting the start frame evaluation (SFE) bit low for at least one frame. Then the evaluation starts when the SFE bit in the Internal Mode Selection (IMS) register is changed from low to high. One frame later, the complete frame evaluation (CFE) bit of the frame alignment register changes from low to high to signal that a valid offset measurement is ready to be read from bits 0 to 9 of the FAR register. The SFE bit must be set to zero before a new measurement cycle is started.

| Timing Signals | ST-BUS Mode | CT Bus Mode | HMVIP Mode |
|---------------------------------|--------------|-------------|------------|
| F0i Width | 61ns | 122ns | 244ns |
| $\overline{C4i}/\overline{C8i}$ | Not Required | 8.192MHz | 4.096MHz |
| C16i | 16.384MHz | | |
| F0o Width | 244ns | | |
| C4o | 4.096MHz | | |

Table 1 - Timing Signals Requirements for Various Operation Modes

| DMS Register Bits | | | Modes | Backplane Interface | Data Rate |
|-------------------|------|------|--------------------|---------------------|---------------|
| BMS2 | BMS1 | BMS0 | | | |
| 0 | 0 | 0 | 2Mb/s, ST-BUS Mode | STio0 - 31 | 2.048 Mb/s |
| 0 | 0 | 1 | 2Mb/s, CT Bus Mode | STio0 - 31 | 2.048 Mb/s |
| 0 | 1 | 0 | 4Mb/s, ST-BUS Mode | STio0 - 31 | 4.096 Mb/s |
| 0 | 1 | 1 | 4Mb/s, CT Bus Mode | STio0 - 31 | 4.096 Mb/s |

Table 3 - Mode Selection for Local Interface

The falling edge of the frame measurement signal (FEi) is evaluated against the falling edge of the frame pulse (FOi). Table 8 and Figure 8 describe the frame alignment register.

3.6 Memory Block Programming

The MT90863 has two connection memories: the backplane connection memory and the local connection memory. The local connection memory is partitioned into high and low parts. The IMS register provides users with the capability of initializing the local connection memory low and the backplane connection memory in two frames. Bit 11 to bit 13 of every backplane connection memory location will be programmed with the pattern stored in bit 7 to bit 9 of the IMS register. Bit 12 to 15 of every local connection memory low location will be programmed with the pattern stored in bits 3 to 6 of the IMS register.

The block programming mode is enabled by setting the memory block program (MBP) bit of the control register high. When the block programming enable (BPE) bit of the IMS register is set to high, the block programming data will be loaded into bits 11 to 13 of every backplane connection memory and bits 12 to 15 of every local connection memory low. The other connection memory bits are loaded with zeros. When the memory block programming is complete, the device resets the BPE bit to zero. See Figure 7 for the connection memory contents when the device is in block programming mode.

4.0 Delay Through the MT90863

The switching of information from the input serial streams to the output serial streams results in a throughput delay. The device can be programmed to perform time-slot interchange functions with different throughput delay capabilities on a per-channel basis. For voice applications, select variable throughput delay to ensure minimum delay between input and output data. In wideband data applications, select constant throughput delay to maintain the frame integrity of the information through the switch.

The delay through the device varies according to the type of throughput delay selected in the $\overline{LV/C}$ and $\overline{BV/C}$ bits of the local and backplane connection memory as described in Table 16 and Table 19.

4.1 Variable Delay Mode ($\overline{LV/C}$ or $\overline{BV/C}$ bit = 0)

The delay in this mode is dependent only on the combination of source and destination channels and is independent of input and output streams.

4.2 Constant Delay Mode ($\overline{LV/C}$ bit or $\overline{BV/C}$ = 1)

In this mode a multiple data memory buffer is used to maintain frame integrity in all switching configurations.

5.0 Microprocessor Interface

The MT90863 provides a parallel microprocessor interface for non-multiplexed bus structures. This interface is compatible with Motorola non-multiplexed buses. The required microprocessor signals are the 16-bit data bus (D0-D15), 8-bit address bus (A0-A7) and 4 control lines (\overline{CS} , \overline{DS} , \overline{RW} and \overline{DTA}). See Figure 16 - Figure 16 for Motorola non-multiplexed bus timing.

The MT90863 microprocessor port provides access to the internal registers, connection and data memories. All locations provide read/write access except for the Data Memory and the Data Read Register which are read only.

5.1 Memory Mapping

The address bus on the microprocessor interface selects the internal registers and memories of the MT90863. If the A7 address input is low, then the registers are addressed by A6 to A0 as shown in Table 4.

If the A7 is high, the remaining address input lines are used to select the serial input or output data streams corresponding to the subsection of memory positions. For data memory reads, the serial inputs are selected. For connection memory writes, the serial outputs are selected.

The control, device mode selection and internal mode selection registers control all the major functions of the device. The device mode selection register and internal mode selection register should be programmed

immediately after system power-up to establish the desired switching configuration as explained in the Frame Alignment Timing and Switching Configurations sections.

The control register is used to control the switching operations in the MT90863. It selects the internal memory locations that specify the input and output channels selected for switching.

Control register data consists of: the memory block programming bit (MBP): the memory select bits (MS0-2); and, the stream address bits (STA0-4). The memory block programming bit allows users to program the entire connection memory block, (see Memory Block Programming section). The memory select bits control the selection of the connection memory or the data memory. The stream address bits define an internal memory subsections corresponding to serial input or serial output streams.

| Notes: 1. Bit A7 must be high for access to data and connection memory positions. Bit A7 must be low for access to registers. 2. Channels 0 to 31 are used when serial stream is at 2Mb/s. 3. Channels 0 to 127 are used when serial stream is at 8Mb/s | | | | | | | | |

Table 4 - Address Memory Map (continued)

The data in the DMS register consists of the local and backplane mode selection bits (LMS0-1 and BMS0-2) to enable various switching modes for local and backplane interfaces respectively.

The data in the IMS register consists of block programming bits (LBPD0-3 and BBPD0-2), block programming enable bit (BPE), output standby bit (OSB) and start frame evaluation bit (SFE). The block programming enable bit allows users to program the entire backplane and local connection memories, (see Memory Block Programming section). If the ODE pin is low, the OSB bit enables (if high) or disables (if low) all ST-BUS output drivers. If the ODE pin is high, the contents of the OSB bit is ignored and all ST-BUS output drivers are enabled.

See Table 5 for the output high impedance control.

5.2 Address Buffer Mode

The implementation of the address buffer, data read and data write registers allows faster memory read/write operation for the microprocessor port. See Table 6 and following for bit assignments.

The address buffer mode is controlled by the AB bit in the control register. The targeted memory for data read/write is selected by the MS0-2 bits in the control register.

The data write register (DWR) contains the data to be transferred to the memory. The data read register (DRR) contains the data transferred from the memory.

The address buffer register (ABR) allow users to specify the read or write address by programming the stream address bits (SA0-4) and the channel address bits (CA0-6). Data transfer from/to the memory is controlled by the read/write select bits (RS, WS). The complete data access (CDA) bit indicates the completion of data transfer between the memory and DWR or DRR register.

5.3 Write Operation Using Address Buffer Mode

Enable the address buffer mode by setting the AB bit from low to high. Program the DWR register with data to be transferred to memory. Load the ABR register with proper channel and stream information. Change the WS bit in the ABR register from low to high to initiate the data transfer from the DWR register to the memory. After several master clock cycles, the CDA bit in the ABR register changes from low to high to signal the completion of data transfer and resets the WS bit to low. Repeat the above steps for subsequent memory write operations. Disable the address buffer write operation by setting the AB bit to low.

5.4 Read Operation Using Address Buffer Mode

Enable the address buffer mode by setting the AB bit from low to high. Program the ABR register with proper channel and stream information. Change the RS bit in the ABR register from low to high to initiate the data transfer from the memory to the DRR register. After several master clock cycles, the CDA bit in the ABR register changes from low to high to signal the completion of data transfer and resets the RS bit to low. Read the DRR register to obtain the data transferred from the memory. Repeat the above steps for subsequent memory read operations. Disable the address buffer read operation by setting the AB bit to low.

5.5 Backplane Connection Memory Control

The backplane connection memory controls the switching configuration of the backplane interface. Locations in the backplane connection memory are associated with particular STio output streams.

The \overline{BV}/C (Variable/Constant Delay) bit of each backplane connection memory location allows the per-channel selection between variable and constant throughput delay modes for all STio channels.

In message mode, the message channel (BMC) bit of the backplane connection memory enables (if high) an associated STio output channel. If the BMC bit is low, the contents of the backplane connection memory stream address bit (BSAB) and channel address bit (BCAB) defines the source information (stream and channel) of the time-slot that will be switched to the STio streams. When message mode is enabled, only the lower half (8 least significant bits) of the backplane connection memory is transferred to the STio pins.

| ODE pin | OSB bit in IMS register | DC bit in Backplane CM | STio0-31 Output Driver Status | OE bit in Local CM | STo0-15 Output Driver Status |
|------------|-------------------------|------------------------|-------------------------------|--------------------|------------------------------|
| Don't Care | Don't Care | 0 | Per Channel High Impedance | 0 | Per Channel High Impedance |
| 0 | 0 | Don't care | High Impedance | Don't care | High Impedance |
| 0 | 1 | 1 | Enable | 1 | Enable |
| 1 | Don't care | 1 | Enable | 1 | Enable |

Table 7 - Device Mode Selection (DMS) Register Bits (continued)

5.6 Local Connection Memory Control

The local connection memory controls the local interface switching configuration. Local connection memory is split into high and low parts. Locations in local connection memory are associated with particular STo output streams.

The L/B (Local/Backplane Select) bit of each local connection memory location allows per-channel selection of source streams from local or backplane interface.

The $\overline{LV/C}$ (Variable/Constant Delay) bit of each local connection memory location allows the per-channel selection between variable and constant throughput delay modes for all STo channels.

In message mode, the local connection memory message channel (LMC) bit enables (if high) an associated STo output channel. If the LMC bit is low, the contents of the stream address bit (LSAB) and the channel address bit (LCAB) of the local connection memory defines the source information (stream and channel) of the time-slot that will be switched to the STo streams. When message mode is enabled, only the lower half (8 least significant bits) of the local connection memory low bits are transferred to the STo pins.

When sub-rate switching is enabled, the LSR0-1 bits in the local connection memory high define which bit position contains the sub-rate data.

5.7 \overline{DTA} Data Transfer Acknowledgment Pin

The \overline{DTA} pin is driven LOW by internal logic to indicate (to the CPU) that a data bus transfer is complete. When the bus cycle ends, this pin drives HIGH and then switches to the high-impedance state. If a short or signal contention prevents the \overline{DTA} pin from reaching a valid logic HIGH, it will continue to drive for approximately 15nsec before switching to the high-impedance state.

6.0 Initialization of the MT90863

During power up, the $\overline{\text{TRST}}$ pin should be pulsed low, or held low continuously, to ensure that the MT90863 is in the normal operation mode. A 5K Ω pull-down resistor can be connected to this pin so that the device will not enter the JTAG test mode during power up.

After power up, the contents of the connection memory can be in any state. The ODE pin should be held low after power up to keep all serial outputs in a high impedance state until the microprocessor has initialized the switching matrix. This procedure prevents two serial outputs from driving the same stream simultaneously.

During the microprocessor initialization routine, the microprocessor should program the desired active paths through the switch. The memory block programming feature can also be used to quickly initialize the DC and OE bit in the backplane and local connection memory respectively.

When this process is complete, the microprocessor controlling the matrices can either bring the ODE pin high or enable the OSB bit in IMS register to relinquish the high impedance state control.

| 0 | 0 | 0 | 0 | 0 | 0 | 0 | BBPD 2 | BBPD 1 | BBPD 0 | LBPD 3 | LBPD 2 | LBPD 1 | LBPD 0 | BPE | OSB | SFE | | |
| Bit | Name | Description | | | | | | | | | | | | | | | | |
| 15-10 | Unused | Must be zero for normal operation. | | | | | | | | | | | | | | | | |
| 9-7 | BBPD2-0 | Backplane Block Programming Data. These bits carry the value to be loaded into the backplane connection memory block when the Memory Block Programming feature is active. After the MBP bit in the control register is set to 1 and the BPE bit is set to 1, the contents of bits BBPD2-0 are loaded into the bit 13 to bit 11 position of the backplane connection memory. Bit 15, bit 14 and bit 10 to bit 0 of the backplane connection memory are zeroed. | | | | | | | | | | | | | | | | |
| 6-3 | LBPD3-0 | Local Block Programming Data. These bits carry the value to be loaded into the local connection memory block when the Memory Block Programming feature is active. After the MBP bit in the control register is set to 1 and the BPE bit is set to 1, the contents of bits LBPD3-0 are loaded into the bit 15 to bit 12 position of the local connection memory. Bit 11 to bit 0 of the local connection memory low are zeroed. Bit 15 to bit 0 of local connection memory high are zeroed. | | | | | | | | | | | | | | | | |
| 2 | BPE | Begin Block Programming Enable. A zero to one transition of this bit enables the memory block programming function. The BPE, BBPD2-0 and LBPD3-0 bits in the IMS register must be defined in the same write operation. Once the BPE bit is set high, the device requires two frames to complete the block programming. After the programming function has finished, the BPE bit returns to zero to indicate the operation is completed. When the BPE = 1, the BPE or MBP can be set to 0 to abort the programming operation. When BPE = 1, the other bits in the IMS register must not be changed for two frames to ensure proper operation. | | | | | | | | | | | | | | | | |

Table 11 - Offset Bits (IFn2, IFn1, IFn0, DLEn) & Input Offset Bits (FD9, FD2-0)

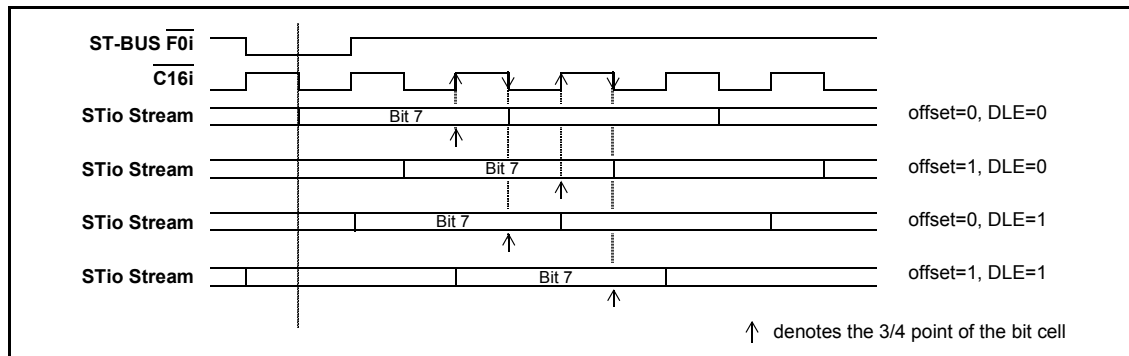

Figure 9 - Examples for Input Offset Delay Timing

Read/Write Address: 0A_H for FOR0 register,
 0B_H for FOR1 register,
 Reset value: 0000_H for all FOR registers.

FOR0 register

FOR1 register

| Bit | Name (Note 1) | Description |
|---------------------------|-----------------|---|
| 15-0 (FOR0) 7-0 (FOR1) | OF _n | Output Offset Bit. When 0, the first bit of the serial output stream has normal alignment with the frame pulse. When 1, the first bit of the serial output stream is advanced by 1/2 CLK cycle with respect to the frame pulse. See Figure 10 -. |
| 15-8 (FOR1) | Unused | Must be zero for normal operation. |

Note 1: n denotes a STio stream number from 0 to 23

Table 12 - Frame Output Offset (FOR) Register Bits

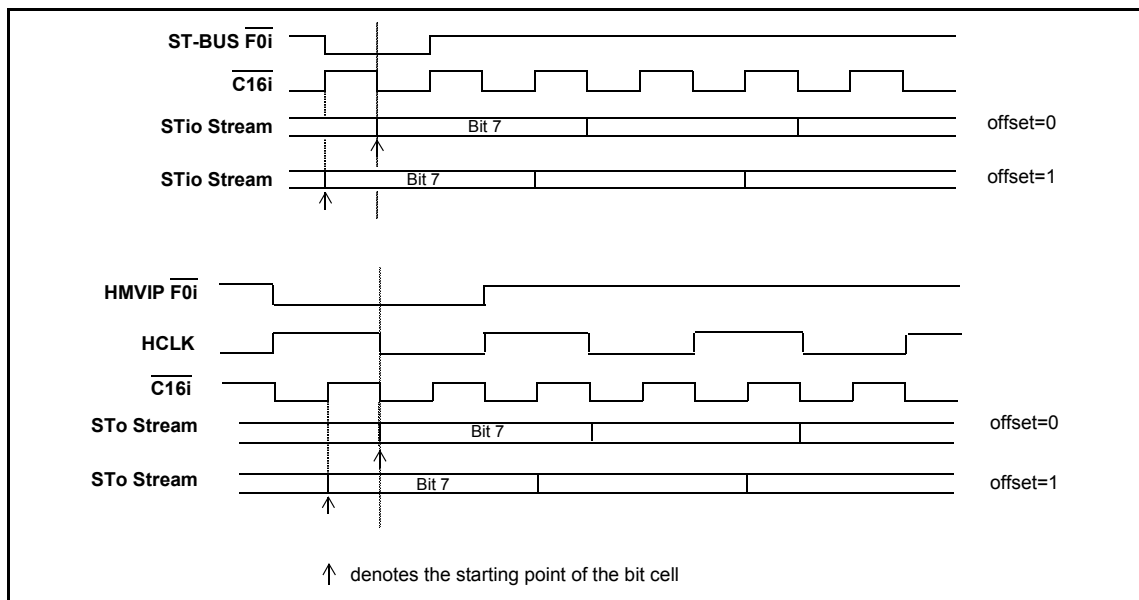

Figure 10 - Examples for Frame Output Offset Timing

| Read/Write Address: 0C _H for ABR register, | | | | | | | | | | | | | | | |
|---|-----------|--|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Reset value: 0000 _H | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0 | CDA | RS | WS | CA6 | CA5 | CA4 | CA3 | CA2 | CA1 | CA0 | SA4 | SA3 | SA2 | SA1 | SA0 |
| Bit | Name | Description | | | | | | | | | | | | | |
| 15 | unused | Reserved | | | | | | | | | | | | | |
| 14 | CDA | Complete Data Access. This bit is read only. This bit changes from 0 to 1 when data transfer is completed between memory and the data read register or data write register. When the RS or WS bit in this register is changed from 1 to 0, this bit is reset to zero. | | | | | | | | | | | | | |
| 13 | RS | Read Select. A zero to one transition of this bit initiates the data transfer from memory to the data read register. This bit is reset to zero when the CDA bit changes from 0 to 1. | | | | | | | | | | | | | |
| 12 | WS | Write Select. A zero to one transition of this bit initiates the data transfer from the data write register to memory. This bit is reset to zero when the CDA bit changes from 0 to 1. | | | | | | | | | | | | | |
| 11 - 5 | CA6 - CA0 | Channel Address Bits. These bits perform the same function as the external address bits when used to access various memory locations. The number (expressed in binary notation) on these bits refers to the input or output data stream channel that corresponds to the subsection of memory. | | | | | | | | | | | | | |
| 4 - 0 | SA4 - SA0 | Stream Address Bits. These bits perform the same function as the STA bits in the control register. The number (in binary notation) on these bits refers to the input or output data stream which corresponds to the subsection of memory. | | | | | | | | | | | | | |

| Bit | Name | Description | | | | | | | | | | | | | |
| 15 - 0 | RD15 - RD0 | Read Data Bits. Data transferred from one of the internal memory locations. | | | | | | | | | | | | | |

Table 15 - Data Read (DRR) Register Bits

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--|----------------|---|-----|----|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|
| 0 | 0 | BV/C | BMC | DC | BSAB ₃ | BSAB ₂ | BSAB ₁ | BSAB ₀ | BCAB ₆ | BCAB ₅ | BCAB ₄ | BCAB ₃ | BCAB ₂ | BCAB ₁ | BCAB ₀ |
| Bit | Name | Description | | | | | | | | | | | | | |
| 15,14 | Unused | Must be zero for normal operation. | | | | | | | | | | | | | |
| 13 | B \bar{V} /C | Variable /Constant Throughput Delay. This bit is used to select either variable (low) or constant delay (high) modes on a per-channel basis for the local interface streams. | | | | | | | | | | | | | |
| 12 | BMC | Message Channel. When 1, the backplane connection memory contents are output on the corresponding output channel and stream. Only the lower byte (bit 7 - bit 0) will be output to the backplane interface STio pins. When 0, the local data memory address of the switched STi input channel and stream is loaded into the backplane connection memory. | | | | | | | | | | | | | |
| 11 | DC | Directional Control. This bit enables the STio pindrivers on a per-channel basis. When 1, the STio output driver functions normally. When 0, the STio output driver is in a high-impedance state. | | | | | | | | | | | | | |
| 10-7 (Note 1) | BSAB3-0 | Source Stream Address Bits. The binary value is the number of the data stream for the source of the connection. | | | | | | | | | | | | | |
| 6-0 (Note 1) | BCAB6-0 | Source Channel Address Bits. The binary value identifies the channel for the connection source. | | | | | | | | | | | | | |
| <p>Note 1: If bit 12 (BMC) of the corresponding backplane connection memory location is 1 (device in message mode), then these entire 8 bits (BSAB0, BCAB6 - BCAB0) are output on the output channel and stream associated with this location.</p> | | | | | | | | | | | | | | | |

Table 16 - Blackplane Connection Memory Bits

| Data Rate | BSAB3 to BSAB0 Bits Used to Determine the Source Stream of the connection |
|----------------------------------|---|
| 2.048 Mb/s | STi0 to STi15 |
| 8.192 Mb/s | STi0 to STi3 |
| 2.048 Mb/s Sub-rate Switching | STi0 to STi12 |

Table 17 - BSAB Bits Programming for Different Local Interface mode

| Data Rate | BCAB Bits Used to Determine the Source Channel of the Connection |
|----------------------------------|---|
| 2.048 Mb/s | BCAB4 to BCAB0 (32 channel/frame) |
| 8.192 Mb/s | BCAB6 to BCAB0 (128 channel/frame) |
| 2.048 Mb/s Sub-rate Switching | BCAB4 to BCAB0 (32 channel/frame) BCAB6 to BCAB0 (128 channel/frame) |

Table 18 - BCAB Bits Programming for Different Data Rates

| 1,0 (Note1) | LSR1, LSR0 | Local Sub-rate Switching Bit When 11 Bit7-6 will be the output of the subrate switching stream When 10 Bit5-4 will be the output of the subrate switching stream When 01 Bit3-2 will be the output of the subrate switching stream When 00 Bit1-0 will be the output of the subrate switching stream | | | | | | | | | | | | | |
| Note 1: If bit 12 (LMC) of the corresponding local connection memory location is 1 (device in message mode), then these entire 8 bits (Bit7-0) are output on the output channel and stream associated with this location. | | | | | | | | | | | | | | | |

Table 22 - Local Connection Memory High Bits

7.0 JTAG Support

The MT90863 JTAG interface conforms to the Boundary-Scan IEEE1149.1 standard. This standard specifies a design-for-testability technique called Boundary-Scan Test (BST). The operation of the boundary-scan circuitry is controlled by an external Test Access Port (TAP) Controller.

7.1 Test Access Port (TAP)

The Test Access Port (TAP) accesses the MT90863 test functions. It consists of three input pins and one output pin as follows:

- Test Clock Input (TCK)**
 TCK provides the clock for the test logic. The TCK does not interfere with any on-chip clock and thus remains independent. The TCK permits shifting of test data into or out of the Boundary-Scan register cells concurrently with the operation of the device and without interfering with the on-chip logic.
- Test Mode Select Input (TMS)**
 The TAP Controller uses the logic signals received at the TMS input to control test operations. The TMS signals are sampled at the rising edge of the TCK pulse. This pin is internally pulled to Vdd when it is not driven from an external source.
- Test Data Input (TDi)**
 Serial input data applied to this port is fed either into the instruction register or into a test data register, depending on the sequence previously applied to the TMS input. Both registers are described in a subsequent section. The received input data is sampled at the rising edge of TCK pulses. This pin is internally pulled to Vdd when it is not driven from an external source.
- Test Data Output (TDo)**
 Depending on the sequence previously applied to the TMS input, the contents of either the instruction register or data register are serially shifted out towards the TDo. The data out of the TDo is clocked on the falling edge of the TCK pulses. When no data is shifted through the boundary scan cells, the TDo driver is set to a high impedance state.
- Test Reset (TRST)**
 Reset the JTAG scan structure. This pin is internally pulled to VDD.

Table 23 - Boundary Scan Register Bits (continued)

Absolute Maximum Ratings*

| | Parameter | Symbol | Min | Max | Units |
|---|---------------------------|----------|------|----------------|-------|
| 1 | Supply Voltage | V_{DD} | -0.5 | 5.0 | V |
| 2 | Input Voltage | V_I | -0.5 | $V_{DD} + 0.5$ | V |
| 3 | Output Voltage | V_o | -0.5 | $V_{DD} + 0.5$ | V |
| 4 | Package power dissipation | P_D | | 2 | W |
| 5 | Storage temperature | T_S | - 55 | +125 | °C |

* Exceeding these values may cause permanent damage. Functional operation under these conditions is not implied.

Recommended Operating Conditions - Voltages are with respect to ground (V_{SS}) unless otherwise stated.

| | Characteristics | Sym | Min | Typ | Max | Units | Test Conditions |
|---|--|----------|-------------|-----|-------------|-------|-----------------|
| 1 | Operating Temperature | T_{OP} | -40 | | +85 | °C | |
| 2 | Positive Supply | V_{DD} | 3.0 | | 3.6 | V | |
| 3 | Input High Voltage | V_{IH} | $0.7V_{DD}$ | | V_{DD} | V | |
| 4 | Input High Voltage on 5V Tolerant Inputs | V_{IH} | | | 5.5 | V | |
| 5 | Input Low Voltage | V_{IL} | V_{SS} | | $0.3V_{DD}$ | V | |

AC Electrical Characteristics - Voltages are with respect to ground (V_{SS}) unless otherwise stated.

| | | Characteristics | Sym | Min | Typ | Max | Units | Test Conditions |
|---|---------------------------------|---|----------------------|-------------|-----|-------------|--------------------|--------------------------------------|
| 1 | I N P U T S | Supply Current | I_{DD} | | 52 | 85 | mA | Output unloaded |
| 2 | | Input High Voltage | V_{IH} | $0.7V_{DD}$ | | | V | |
| 3 | | Input Low Voltage | V_{IL} | | | $0.3V_{DD}$ | V | |
| 4 | | Input Leakage (input pins) Input Leakage (bi-directional pins) | I_{IL} I_{BL} | | | 10 50 | μ A μ A | $0 \leq V \leq V_{DD}$ See Note 1 |
| 5 | | Input Pin Capacitance | C_I | | | 10 | pF | |
| 6 | O U T P U T S | Output High Voltage | V_{OH} | $0.8V_{DD}$ | | | V | $I_{OH} = 10mA$ |
| 7 | | Output Low Voltage | V_{OL} | | | 0.4 | V | $I_{OL} = 10mA$ |
| 8 | | High Impedance Leakage | I_{OZ} | | | 5 | μ A | $0 < V < V_{DD}$ See Note 1 |
| 9 | | Output Pin Capacitance | C_O | | | 10 | pF | |

Note:

1. Maximum leakage on pins (output or I/O pins in high impedance state) is over an applied voltage (V)

AC Electrical Characteristics - Timing Parameter Measurement Voltage Levels

| | Characteristics | Sym | Level | Units | Conditions |
|---|----------------------------------|----------|-------------|-------|------------|
| 1 | CMOS Threshold | V_{CT} | $0.5V_{DD}$ | V | |
| 2 | Rise/Fall Threshold Voltage High | V_{HM} | $0.7V_{DD}$ | V | |
| 3 | Rise/Fall Threshold Voltage Low | V_{LM} | $0.3V_{DD}$ | V | |

* Exceeding these values may cause permanent damage. Functional operation under these conditions is not implied

AC Electrical Characteristics - Frame Pulse and CLK

| | Characteristic | Sym | Min | Typ | Max | Units | Notes |
|----|--|------------------|-----|-----|-----|-------|------------------------------|
| 1 | Frame pulse width | t_{FPW} | | 60 | | ns | ST-BUS mode |
| 2 | Frame Pulse Setup time before $\overline{C16i}$ falling | t_{FPS} | | 10 | | ns | |
| 3 | Frame Pulse Hold Time from $\overline{C16i}$ falling | t_{FPH} | | 10 | | ns | |
| 4 | $\overline{C16i}$ Period | t_{CP} | | 60 | | ns | ST-BUS, CT Bus or HMVIP mode |
| 5 | $\overline{C16i}$ Pulse Width High | t_{CH} | | 30 | | ns | |
| 6 | $\overline{C16i}$ Pulse Width Low | t_{CL} | | 30 | | ns | |
| 7 | Clock Rise/Fall Time | t_r, t_f | | 10 | | ns | |
| 8 | FPo Frame pulse output width | t_{FPOW} | | 244 | | ns | |
| 9 | FPo Frame Pulse output setup time before $\overline{C4o}$ falling | t_{FPOS} | 10 | | 150 | ns | |
| 10 | FPo Frame Pulse output Hold Time from $\overline{C4o}$ falling | t_{FPOH} | 20 | 10 | 150 | ns | |
| 11 | $\overline{C4o}$ Period | t_{C4OP} | | 244 | | ns | |
| 12 | $\overline{C4o}$ Pulse Width High | t_{C40H} | | 122 | | ns | |
| 13 | $\overline{C4o}$ Pulse Width Low | t_{C40L} | | 122 | | ns | |
| 14 | CT frame pulse width | t_{CFPW} | | 122 | | ns | CT Bus mode |
| 15 | CT Frame Pulse Setup Time before $C8i$ rising | t_{CFPS} | 45 | | 90 | ns | |
| 16 | CT Frame Pulse Hold Time from $C8i$ rising | t_{CFPH} | 45 | | 90 | ns | |
| 17 | $C8i$ Period | t_{HCP} | | 122 | | ns | |
| 18 | $C8i$ Pulse Width High | t_{HCH} | | 61 | | ns | |
| 19 | $C8i$ Pulse Width Low | t_{HCL} | | 61 | | ns | HMVIP mode |
| 20 | HMVIP frame pulse width | t_{HFPW} | | 244 | | ns | |
| 21 | Frame Pulse Setup Time before $C4i$ falling | t_{HFPS} | 50 | | 150 | ns | |
| 22 | Frame Pulse Hold Time from $C4i$ falling | t_{HFPH} | 50 | | 150 | ns | |
| 23 | $C4i$ Period | t_{HCP} | | 244 | | ns | |
| 24 | $C4i$ Pulse Width High | t_{HCH} | | 122 | | ns | |
| 25 | $C4i$ Pulse Width Low | t_{HCL} | | 122 | | ns | |
| 26 | $\overline{C4i}/C8i$ Rise/Fall Time | t_{Hr}, t_{Hf} | | 10 | | ns | HMVIP or CT Bus mode |
| 27 | Delay between falling edge of $\overline{C4i}/C8i$ and rising edge of $C16i$ | t_{DIF} | -10 | | 10 | ns | |
| 28 | Delay between falling edge of $C16i$ and falling edge of $C4o$ | t_{DC4O} | -10 | | 10 | ns | |

AC Electrical Characteristics - Serial Streams for Backplane and Local Interfaces

| | Characteristic | Sym | Min | Typ | Max | Units | Test Conditions |
|---|--|-----------|-----|-----|-----|-------|---|
| 1 | STio/STi Set-up Time | t_{SIS} | 0 | | | ns | |
| 2 | STio/STi Hold Time | t_{SIH} | 6 | | | ns | |
| 3 | STo Delay - Active to Active | t_{SOD} | 5 | 16 | 32 | ns | $C_L=200pF$ |
| 4 | STo delay - Active to High-Z - High-Z to Active | t_{ZD} | | | 35 | ns | $R_L=1K, C_L=200pF, \text{ See Note 1}$ |
| 5 | Output Driver Enable (ODE) Delay | t_{ODE} | | | 35 | ns | |

Note:

1. High Impedance is measured by pulling to the appropriate rail with R_L , with timing corrected to cancel time taken to discharge C_L .

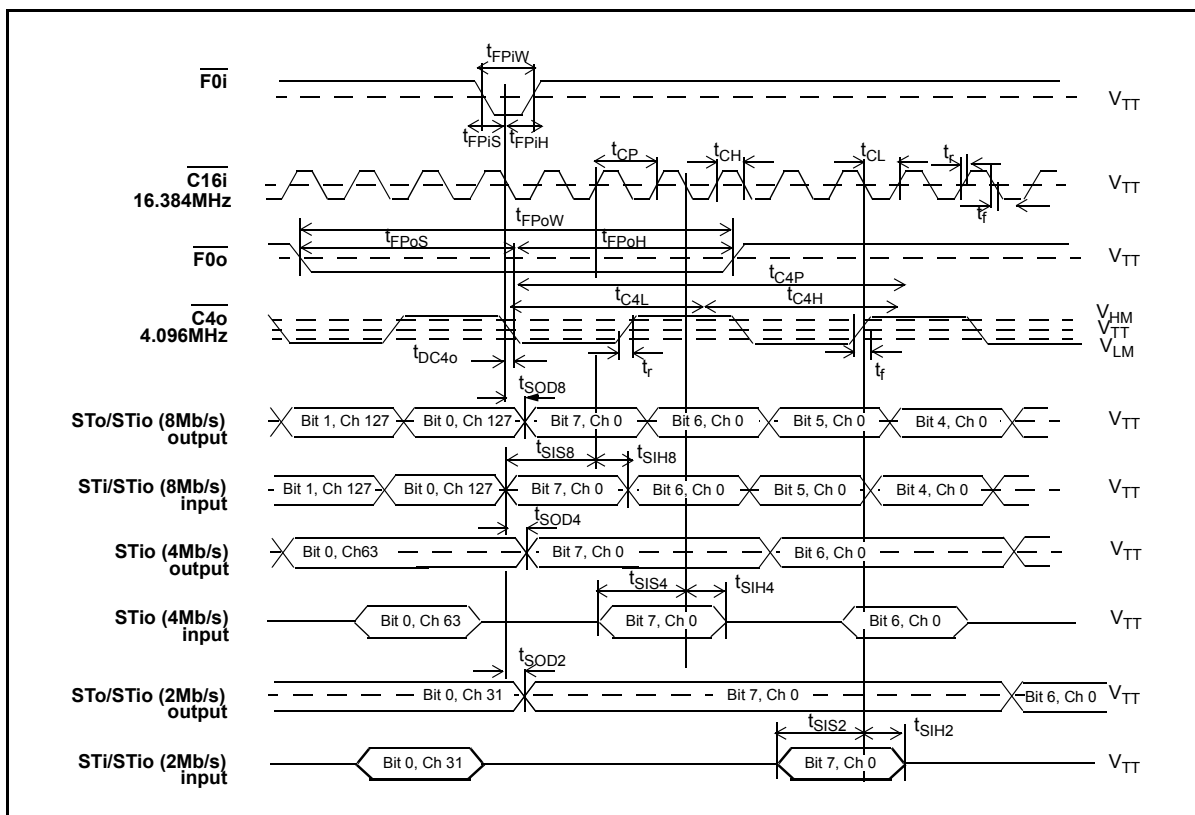

Figure 11 - ST-BUS Timing for Stream rate of 2.048, 4.096 or 8.192 Mb/s

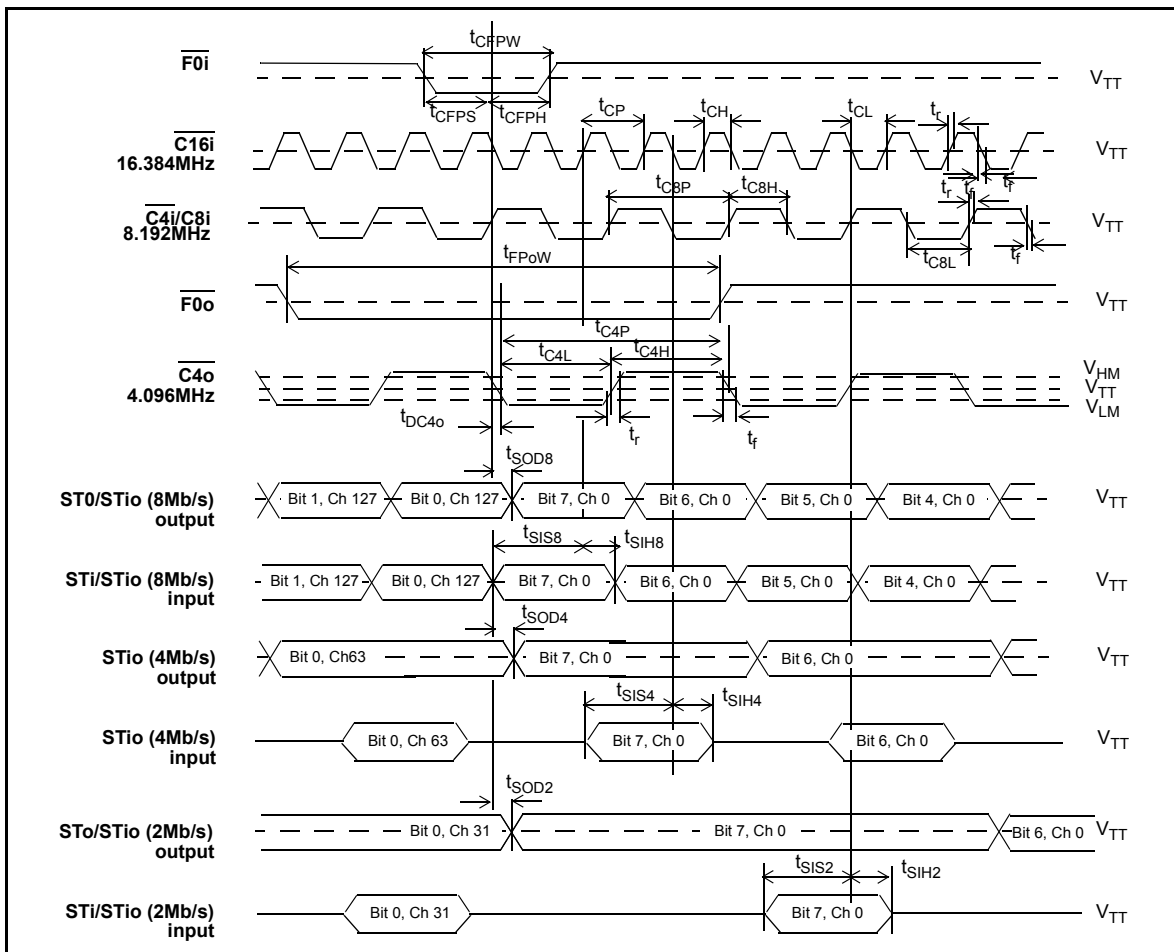

Figure 12 - CT Bus Timing for Stream rate of 2.048, 4.096 or 8.192 Mb/s

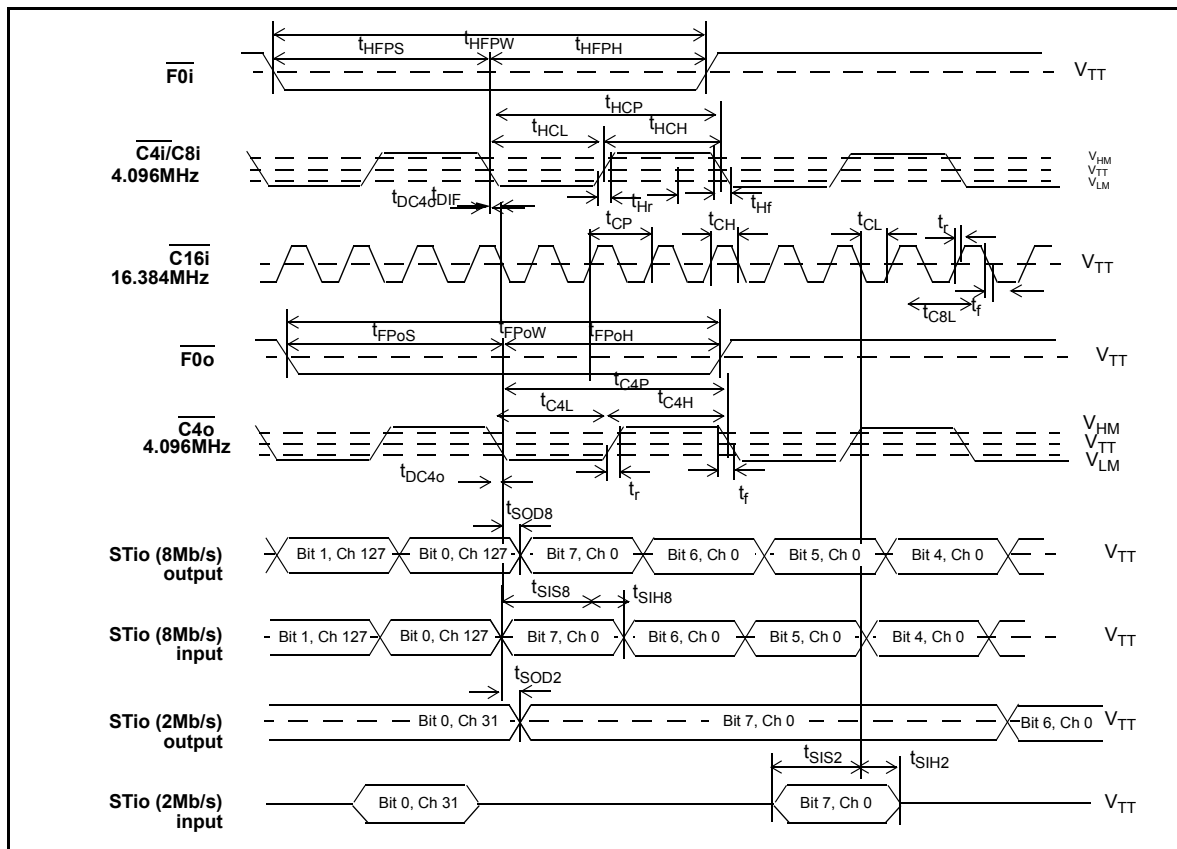

Figure 13 - HMVIP Bus Timing for Stream rate of 2.048 Mb/s or 8.192 Mb/s

Figure 14 - Serial Output and External Control

Figure 15 - Output Driver Enable (ODE)

AC Electrical Characteristics - Motorola Non-Multiplexed Bus Mode

| | Characteristics | Sym | Min | Typ | Max | Units | Test Conditions |
|----|--|----------------------------------|-----|-----|-----------|-------|------------------------------------|
| 1 | CS setup from DS falling | t_{CSS} | | 0 | | ns | |
| 2 | R/W setup from DS falling | t_{RWS} | | 10 | | ns | |
| 3 | Address setup from DS falling | t_{ADS} | | | 5 | ns | |
| 4 | CS hold after DS rising | t_{CSH} | | 10 | | ns | |
| 5 | R/W hold after DS rising | t_{RWH} | | 10 | | ns | |
| 6 | Address hold after DS rising | t_{ADH} | | | 6 | ns | |
| 7 | Data setup from DTA low on read Reading registers Reading Memory | t_{DDR_REG} t_{DDR_MEM} | | | 16 440 | ns | $C_L=50pF$ |
| 8 | Data hold on read | t_{DHR} | | | 11 | ns | $C_L=50pF$, $R_L=1K$ Note 1 |
| 9 | Data setup on write (fast write) | t_{DSW_REG} | | | 2 | ns | |
| 10 | Valid data delay on write (slow write) | t_{SWD} | | | 150 | ns | |
| 11 | Data hold on write | t_{DHW} | 5 | | | ns | |
| 12 | Acknowledgment delay: Reading/writing registers Reading/writing memory | t_{AKD_REG} t_{AKD_MEM} | | | 40 470 | ns | $C_L=50pF$ |
| 13 | Acknowledgment hold time | t_{AKH} | | | 17 | ns | $C_L=50pF$, $R_L=1K$, Note |

Note:

1. High Impedance is measured by pulling to the appropriate rail with R_L , with timing corrected to cancel time taken to discharge C_L .

| NOTE | SQUARE | | | |

Conforms to JEDEC MS-022 DB Iss. B

Notes:

1. Pin 1 indicator may be a corner chamfer, dot or both.
2. Controlling dimensions are in millimeters.
3. The top package body size may be smaller than the bottom package body size by a max. of 0.15 mm.
4. Dimension D1 and E1 do not include mould protrusion.
5. Dimension b does not include dambar protrusion.
6. Coplanarity, measured at seating plane G, to be 0.10 mm max.

NOTES: -

1. Controlling dimensions are in MM.
2. Seating plane is defined by the spherical crown of the solder balls.
3. Not to scale.
4. N is the number of solder balls
5. Substrate thickness is 0.56 MM REF.
