

1. Application

This data sheet is to introduce the specification of LM641521, Passive Matrix type LCD Unit.

2. Construction and Outline

Construction: 640X480 dots display unit consisting of an LCD panel, PWB (printed wiring board) with electric components mounted onto, tab (tape automated bonding) to coaaect the LCD panel and PWB electrically, and plastic cabinets to fix them mechanically.

Outline : See lit 8

Connect ioa : See Fig. 8 and Table 8

3. Mechanical Specifications

Table 1

Parameter	Specifications	Unit
Outline dimensions	279.4 (W) × 196.85 (H) × 24.59 MAX (D) #1	mm
Effective viewing Area	196 (W) × 147.6 (H)	mm
Display format	640 (W) × 480 (H) full dot	-
Dot size	0.27 × 0.27	mm
Dot spacing	0.03	mm
#2 Dot color	Black#3	-
#2 Background color	White#3	-
Weight	Approx. 380	g

#1 Excluded PPC.

#2 Due to the characteristics of the LC material the colors vary with environmental temperature.

#3 Positive-type display

Displayed data *H*: Dots ON : Black

Displayed data *L*: Dots off: White

4. Absolute Maximum Ratings

4-L Electrical absolute maximum ratings

Table 2

Parameter	Symbol	MIN.	MAX	Unit	Remark
Supply voltage (Logic)	V _{DD} -V _{SS}	0	6.0	V	T _a =25°C
Supply voltage (LCD drive)	V _{DD} -V _{ZZ}	0	30.0	V	T _a =25°C
Input voltage	V _{IN}	0			T _a =25°C

4-2 Environmental Conditions

Table 3

Item	Tstg		Topr		Remark
	MIN.	Max.	Min.	MAX.	
Ambient temperature	-25°C	+60°C	0°C	+45°C	Note 2
Humidity	Note		Note 1		No condensation
Vibration	Note 2		Note 2		3 directions (X/Y/Z)
Shock	Note 3		Note 3..		6 directions (+X+Y+Z)

Note 1) Ta<40°C 95% RH Max

Ta>40°C Absolute humidity shall be less than Ta=40°C/95% RH

Note 2)

Frequency	5Hz~23Hz	23Hz~500Hz
I Vibratiooo level	-	1. OG
Vibration width	1.0mm	-
Interval	5Hz~500Hz~5Hz/26. 6min	

2 hours for each direction of X/Y/Z (6 hours as total)

Note 3) Acceleration : 50G

Pulse width : 1ms

3 times for each direction of +X/+Y/+Z

Note 4) Care should be taken so that the LCD Unit may not be subjected to the temperature out of this specification

5. Electrical Specifications

5-1 Electrical characteristics

Table 4 $T_a=25^\circ C, V_{dd}=5V \pm 5\%$

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Supply voltage (Logic)	$V_{dd}-V_{ss}$		4.75	5.0	5.25	V
Supply voltage (LCD drive)	$V_{zx}-V_{ss}$	Note 1) Note 2)	-23.0	-18.7	-14.1	V
Input signal voltage	V_{in}	'H' level 'L' level	0.8V _{dd} 0	-	0.2V _{dd}	V
Input leakage current	I_{IL}	'H' level 'L' level	-	-	250	μA
Supply current (Logic)	I_{dd}		-	23.0	33.0	mA
Supply current (LCD drive)	I_{zx}	Note 3)	-	17.5	27.0	mA
Power consumption	P_d		-	450	680	mW

Note 1) The viewing angle _ at which the optimum contrast is obtained by adjusting $V_{zx}-V_{ss}$. Refer to Fig.4 for the definition of θ .

Note 2) Max. and Min. values are specified as the Hat and Min. voltage within the condition of operational temperature range ($0 \sim 45^\circ C$).

Typ. values are specified as the typical voltage at $25^\circ C$.

Note 3) Display high frequency pattern.

$V_{dd} = 5V, V_{zx} - V_{ss} = -18.7V$, Frame frequency = 85Hz, Display pattern = 4bit checker

Clock rise/falltime	t_r, t_f			t_{rf}^{*2}	ns

*1 : LCD unit functions at the ● inirum frame cycle of 8 as (Maximum frame frequency of 125Hz). Owing to the characteristics of LCD unit, shadowing will become more eminent as frame frequency goes up, while flicker will be reduced.

According to our experiments, frame cycle of 11.7 ms Min. or frame frequency of 85 Hz Max. will demonstrate optimum display quality in terms of flicker and shadowing. But since judgement of display quality is subjective and display quality such as 'shadowing' is pattern dependent, it is recommended that decision of frame cycle or frame frequency, to which power consumption of the LCD rait is proportional, be made based on your own through testing on the LCD unit with every possible patterns displayed on it.

*2 : $t_{rf} = 50$ in case $t_{rf} = (T_{CP2} - t_{CWH} - t_{CWL}) / 2 \geq 50$
 $t_{rf} = t_{CP2}$ in case $t_{rf} = (T_{CP2} - t_{CWH} - t_{CWL}) / 2 < 50$

8. Unit Driving Method

8.1 Circuit configuration

Fig. 7 shows the block diagram of the Unit's circuit.

8.2 Display Face Configuration

The display face electrically consists of two (upper and lower) display segments so that the unit may offer higher contrast by reducing drive duty ratio. Each display segment (840×240 dots) is driven at 1/240 duty ratio.

8.3 Input Data and Control Signal

The LCD driver is 80 bits LSI, consisting of shift registers, latch circuits and LCD driver circuits.

Display data which are externally divided into data for each row (840 dots) will be sequentially transferred in the form of 1-bit parallel data through shift registers by Clock Signal CP2 from the left top of the display face.

When data of one row (840 dots) have been input, they will be latched in the form of parallel data for 640 lines of signal electrodes by latch signal CPI. Then the corresponding drive signal will be transmitted to the 640 lines of column electrodes of the LCD panel by the LCD drive circuits.

At this time, scan start-or signal S has been transferred from the scan signal driver to the 1st row of scan electrodes, and the contents of the data signals are displayed on the 1st rows of upper and lower half of the display face according to the combinations of voltages applied to the scan and signal electrodes of the LCD.

While the 1st row of data are being displayed, the 2nd rows of data are entered. When 640 dots of data have been transferred and latched on the falling edge of CPI clock, the display face proceeds to the 2nd rows of display.

Such data input will be repeated up to the 240th row of each display segment, from upper to lower rows, to complete one frame of display by time sharing method. Then data input proceeds to the next display face.

Scan start-up signal S generates scan signals to drive horizontal electrodes.

Since DC voltage, if applied to LCD panel, causes chemical reaction which will deteriorate LCD panel, drive waveform shall be inverted at every display frame to prevent the generation of such DC voltage. Control Signal M plays such role.

Because of the characteristics of the CMOS driver LSI, the power consumption of the circuit goes up as the operating frequency CP2 increases. Thus the driver LSI applies the system of transferring 4-bits parallel data through the 4 lines of shift registers to reduce the data transfer speed CP2. Thanks to the LSI, the power consumption of the unit will be minimized.

In this circuit configuration, 1-bit display data shall be therefore input to data input pins of DU₀₋₃ (upper display segment) and DL₀₋₃ (lower display segment).

Furthermore the LCD unit adopts bus line system for data input to minimize the power consumption. In this system data input terminal of each driver LSI activated only when relevant data input is fed.

Data input for column electrodes of both the upper and the lower display segment and chip select of driver LSI are made as follows:

The driver LSI at the left end of the display face is first selected, and the adjacent driver LSI of the right side is selected when 80 dots data (20CP2) is fed. This process is sequentially continued until data is fed to the driver LSI at the right end of the display face.

This process is simultaneously followed at the column drivers LSI's of both the upper and the lower display segments. Thus data input for both the upper and the lower display repeats must be fed through 4-bit bus line sequentially from the left end of the display face.

Since this graphic display unit contains no internal RAM, it requires data and timing pulse inputs even for static display.

The timing chart of input signals are shown in Fig. 3 and Table 7.

7. Optical Characteristics

 $T_A=25^\circ\text{C}$, $V_{DD}=5.0\text{V}$, $V_{ZX}-V_{SS}=-18.7\text{V TYP}$

Table 8

Following specs are based upon the electrical measuring conditions, on which the contrast of perpendicular direction ($\theta = 0^\circ$) will be MAX.

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit	Remark
Viewing angle range	$\theta_2 - \theta_1$	$\phi = 0^\circ$	$C_o \geq 2.0$	45	-	-	dgr.
	θ_1	$\theta_1 < \theta_2$	$C_o = 2.0$	-	-	-15	dgr.
	θ_2			25	-	-	dgr.
	$\theta_2 - \theta_1$	$\phi = 90^\circ$	$C_o \geq 2.0$	55	-	-	dgr.
	θ_1	$\theta_1 < \theta_2$	$C_o = 2.0$	-	-	-25	dgr.
	θ_2			25	-	-	dgr.
Contrast ratio	C_o	$\theta = 0^\circ, \phi = 0^\circ$	3.0	6.0	-	-	Note 2
Response time	Rise	$\theta = 0^\circ, \phi = 0^\circ$	-	120	170	ns	Note 3
	Decay	$\theta = 0^\circ, \phi = 0^\circ$	-	130	180	ns	

Note 1) The viewing angle range is defined as shown below.

* Angle θ_1 , θ_2 and ϕ shall fall within the range over which the displayed character can be read.

Fig. 4. Definition of Viewing Angle

Note 2) Contrast ratio is defined as follows:

Contrast ratio is calculated by using the following formula when the waveform voltage (Fig. 6) is applied in the optical characteristics test method (Fig. 5).

$$C_o = \frac{\text{Photo-detector output voltage with non-select waveform being replied}}{\text{Photo-detector output voltage with select waveform being replied}}$$

Note 3) The response characteristics of photodetector output are measured as shown in Fig. 6, assuming that input signals are applied so as to select and deselect the dots to be measured, in the optical characteristics test method shown in Fig. 5.

Note ④) Table 8 shows the optical characteristics detected when the LCD applied voltage waveforms are in the highest frequency*.

* The most critical condition for the characteristics of LCD.

8. Precautions

1) Industrial **(Mechanical) design** of the product in which this LCD unit will be incorporated must be so **made** that the **viewing angle** characteristics of the LCD **may be optimized**.

This unit's **viewing angle** is illustrated in Fig. 9.

$$\theta_1 < \text{viewing angle} < \theta_2 (\theta_1 < 0^\circ, \theta_2 \geq 0^\circ)$$

(For the specific values of θ_1, θ_2 , refer to the table 8.)

Please consider the optimum viewing conditions according to the purpose when installing the unit.

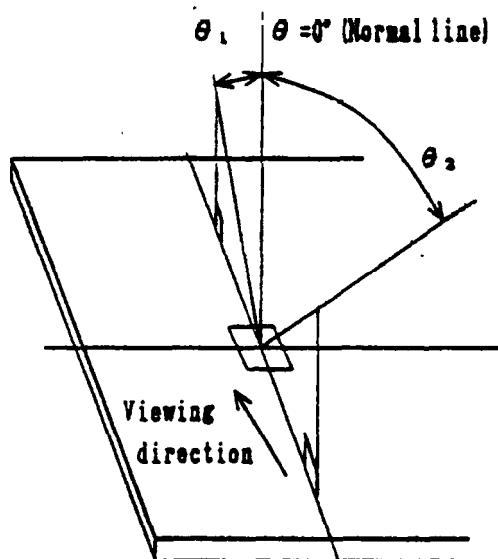

Fig. 9. Dot matrix LCD viewing angle

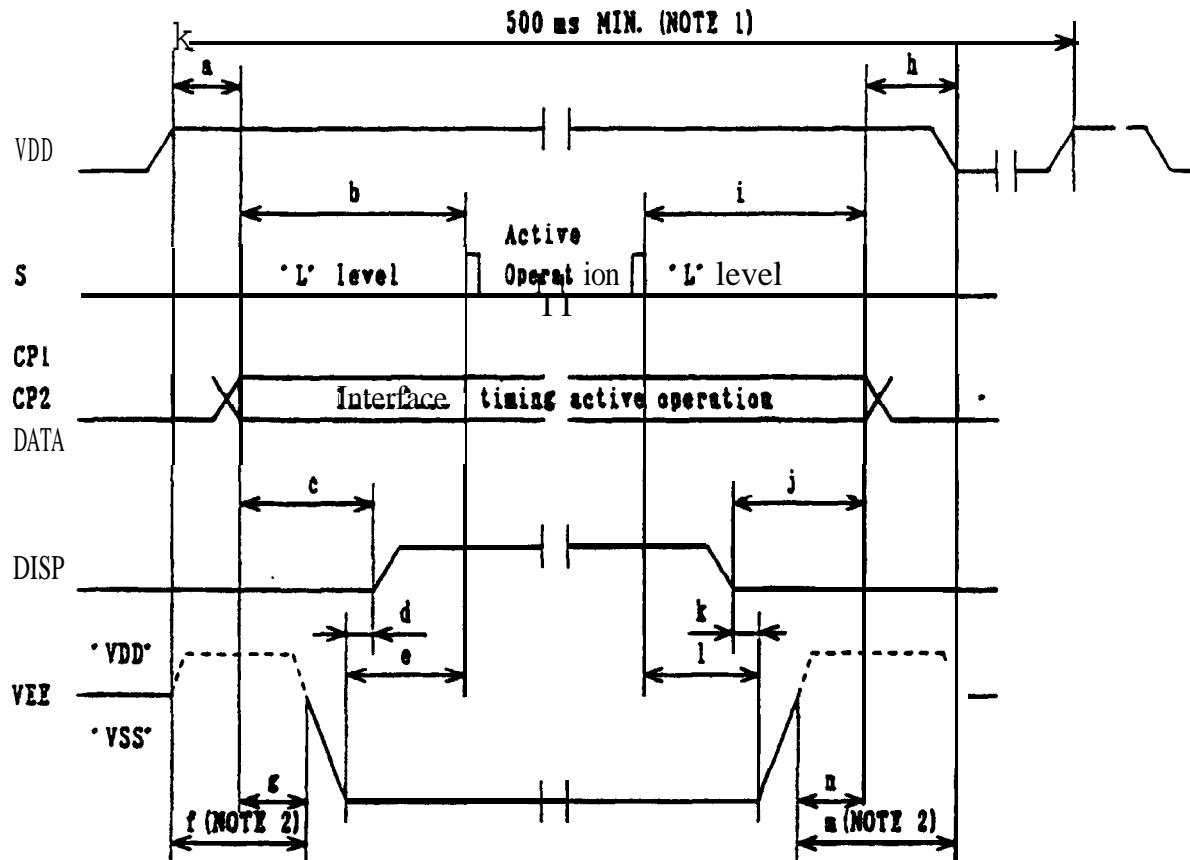

2) This unit is installed using mounting tabs at the four corners of PCB or bezel.

When installing the unit, pay attention and handle carefully not to allow any undue stress such as twist or bend.

A transparent acrylic resin board or other type of protective panel should be attached to the front of the unit to protect the polarizer, LCD cells, etc.

- 3) Since the front polarizer is easily **damaged**, please **pay** attention not to scratch **on** its face.
- 4) If the **surface** of the LCD cells needs to be cleaned, wipe it **swiftly** with cotton or other **soft** cloth. If still not **completely clear**, blow on its **end** and wipe.
- 5) Water droplets, etc. **must** be **wiped off immediately** since **they may** cause color change, staining, etc. if remained for **a long time**.
- 6) Since LCD is **made** of glass **plates**, dropping the unit or banging it against hard objects **may** cause cracking or **fragmentation**.
- 7) CMOS LSIs are **equipped** in this unit, so care **must** be **taken** to avoid the **electro static charge**, by earthing **human body**, etc. Take the **following** measures, to protect the **unit** from the electric discharge **via mounting tabs** from the **main system** the electrified **with static electricity**.
 - (1) Earth the metallic **case** of the **main system** (contact of the unit and **main system**).
 - (2) Insulate the **unit** and **via system** by attaching **insulating** washers **made** of **bakelite** or **nylon**, etc.
- 8) The unit should be driven according to the specified ratings to avoid malfunction of **permanent damage**. DC **voltage** drive leads to rapid deterioration of LC, so ensure that the drive is **alternating waveform** by coating as **application** of the **signal**. Especially the **power ON/OFF sequence** shown on next page is **strongly** recommended to **avoid** **latch-up** of driver LSIs and application of DC **voltage** to LCD **panel**.
- 9) Avoid to expose the **unit** to the direct **sun-light**, **strong ultra-violet light**, etc. **for a long time**.
- 10) If stored at **temperatures below** specified **storage temperature**, the LC **may freeze** and be **deteriorated**. If **storage temperature** exceed the specified **rating**, the **molecular orientation** of the LC **may change** to that of a liquid, and **they may** not revert to their original state. As far as **possible always** store at **normal room temperature**.
- 11) Disassembling the LCD **unit** can cause permanent damage and should be strictly avoided.

Supply voltage sequence condition

POWER ON		
SYMBOL	with DISP control	without DISP control

(Note 1) Power ON/OFF cycle time. All signals and power line shall be in accordance with above sequence in case of power ON/OFF.

(Note 2) VEE to be set at 'VDD level' or 'open'. VEE shord be inaccordance with the dotted line when DISP(display control signal) is not used.

(note3) Connection of DISP (pin No. 4)

With DISP control

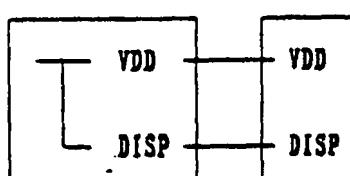

input DISP control signal shown on page.19

Control Circuit LCD UNIT

Without DISP control

DISP to be connected with VDD.

Control Circuit LCD UNIT

9. Applicable inooectioa standard

The LCD unit shall meet the following inspection standard
:S-U-012-01

10. This specification describes display quality in case of no gray scale.
Since display quality can be affected by gray scale methods, display quality shall be carefully evaluated for the usability of the LCD UNIT in case gray scale is displayed on the LCD UNIT.

WARNING

DON'T USE ANY MATERIALS WHICH EMIT FOLLOWING GAS FROM EPOXY RESIN (AMINE)
HARDENER) AND SILICONE ADHESIVE AGENT (DEALCOHOL OR DIOXYME) TO PREVENT
CHANGE POLARIZED COLOR DUE TO GAS.
