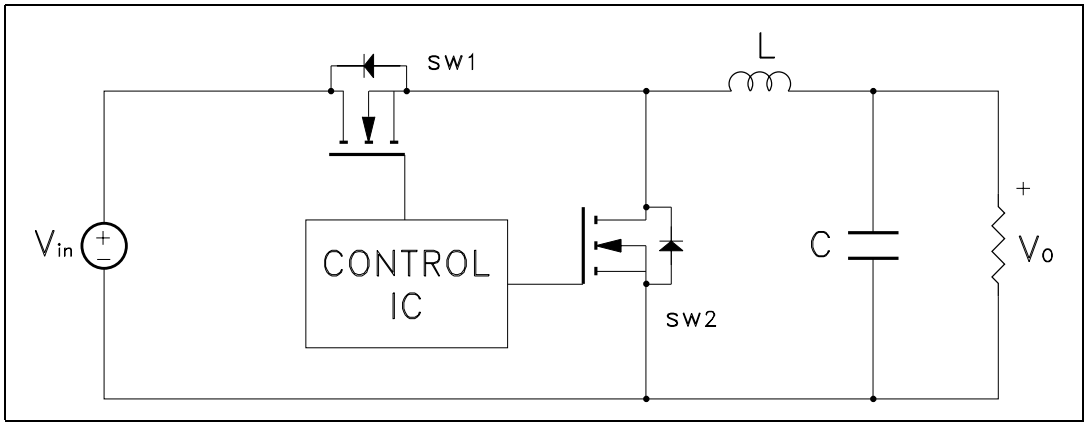
Figure 18. Buck converter: power losses estimation



The power losses associated with the FETs in a synchronous buck converter can be estimated using the equations shown in the table below. The formulas give a good approximation, for the sake of performance comparison, of how different pairs of devices affect the converter efficiency. However a very important parameter, the working temperature, is not considered. The real device behavior is really dependent on how the heat generated inside the devices is removed to allow for a safer working junction temperature.

- The low side (SW2) device requires:
  - Very low $R_{DS(on)}$ to reduce conduction losses
  - Small Qgls to reduce the gate charge losses
  - Small Coss to reduce losses due to output capacitance
  - Small Qrr to reduce losses on SW1 during its turn-on
  - The Cgd/Cgs ratio lower than Vth/Vgg ratio especially with low drain to source
  - voltage to avoid the cross conduction phenomenon;
- The high side (SW1) device requires:
  - Small Rg and Ls to allow higher gate current peak and to limit the voltage feedback on the gate
  - Small Qg to have a faster commutation and to reduce gate charge losses
  - Low $R_{DS(on)}$ to reduce the conduction losses.

Table 6. Power losses calculation

Pconduction		$R_{DS(on)SW1} * I_L^2 * \delta$	$R_{DS(on)SW2} * I_L^2 * (1-\delta)$
Pswitching		$V_{in} * (Q_{gsth(SW1)} + Q_{gd(SW1)}) * f * \frac{I_L}{I_g}$	Zero Voltage Switching
Pdiode	Recovery(1)	Not applicable	$V_{in} * Q_{rr(SW2)} * f$
	Conduction	Not applicable	$V_{f(SW2)} * I_L * t_{deadtime} * f$
