PIN DESCRIPTION

CLK	Fetches all inputs at the "H" edge.
\overline{CS}	Disables or enables device operation by asserting or deactivating all inputs except CLK, CKE and DQM.
CKE	Masks system clock to deactivate the subsequent CLK operation. If CKE is deactivated, system clock will be masked so that the subsequent CLK operation is deactivated. CKE should be asserted at least one cycle prior to a new command.
Address	Row & column multiplexed. Row address: RA0 – RA11 Column address: CA0 – CA9
A12, A13 (BA1, BA0)	Bank Access pins. These pins are dedicated to select one of 4 banks.
\overline{RAS} \overline{CAS} \overline{WE}	Functionality depends on the combination. For details, see the function truth table.
DQM	Masks the read data of two clocks later when DQM is set "H" at the "H" edge of the clock signal. Masks the write data of the same clock when DQM is set "H" at the "H" edge of the clock signal.
DQi	Data inputs/outputs are multiplexed on the same pin.

TIMING WAVEFORM

Read & Write Cycle (Same Bank) @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Single Bit Read-Write-Read Cycle (Same Page) @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

- *Notes:**
1. When \overline{CS} is set "High" at a clock transition from "Low" to "High", all inputs except CKE and DQM are invalid.
 2. When issuing an active, read or write command, the bank is selected by A12 and A13.

A12	A13	Active, read or write
0	0	Bank A
0	1	Bank B
1	0	Bank C
1	1	Bank D

3. The auto precharge function is enabled or disabled by the A10 input when the read or write command is issued.

A10	A12	A13	Operation
0	0	0	After the end of burst, bank A holds the idle status.
1	0	0	After the end of burst, bank A is precharged automatically.
0	0	1	After the end of burst, bank B holds the idle status.
1	0	1	After the end of burst, bank B is precharged automatically.
0	1	0	After the end of burst, bank C holds the idle status.
1	1	0	After the end of burst, bank C is precharged automatically.
0	1	1	After the end of burst, bank D holds the idle status.
1	1	1	After the end of burst, bank D is precharged automatically.

4. When issuing a precharge command, the bank to be precharged is selected by the A10, A12 and A13 inputs.

A10	A12	A13	Operation
0	0	0	Bank A is precharged.
0	0	1	Bank B is precharged.
0	1	0	Bank C is precharged.
0	1	1	Bank D is precharged.
1	X	X	All banks are precharged.

5. The input data and the write command are latched by the same clock (Write latency = 0).
6. The output is forced to high impedance by $(1 \text{ CLK} + t_{OHZ})$ after DQM entry.

Page Read & Write Cycle (Same Bank) @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

- *Notes:**
1. To write data before a burst read ends, DQM should be asserted three cycles prior to the write command to avoid bus contention.
 2. To assert row precharge before a burst write ends, wait t_{WR} after the last write data input. Input data during the precharge input cycle will be masked internally.

Read & Write Cycle with Auto Precharge @ Burst Length = 4

Bank Interleave Random Row Read Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Bank Interleave Random Row Write Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Bank Interleave Page Read Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

***Note:** 1. $\overline{\text{CS}}$ is ignored when $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ are high at the same cycle.

Bank Interleave Page Write Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Bank Interleave Random Row Read/Write Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Bank Interleave Page Read/Write Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Clock Suspension & DQM Operation Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

- *Notes:**
1. When Clock Suspension is asserted, the next clock cycle is ignored.
 2. When DQM is asserted, the read data after two clock cycles is masked.
 3. When DQM is asserted, the write data in the same clock cycle is masked.

Read Interruption by Precharge Command @ Burst Length = 8

***Note:** 1. If row precharge is asserted before burst read ends, then the read data will not output after the second clock cycle of the precharge command.

Power Down Mode @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

- *Notes:**
1. When all banks are in precharge state, and if CKE is set low, then the MD56V62400/H enters power-down mode and maintains the mode while CKE is low.
 2. To release the circuit from power-down mode, CKE has to be set high for longer than $t_{\text{PDE}} (t_{\text{SI}} + 1 \text{ CLK})$.
