

8K x 8 Registered PROM

Functional Description (continued)

If the \overline{E}/I pin is used for \overline{INIT} (asynchronous), then the outputs are permanently enabled. The initialize function is useful during power-up and time-out sequences, and can facilitate implementation of other sophisticated functions such as a built-in "jump start" address. When activated, the initialize control input causes the contents of a user programmed 8193rd 8-bit word to be loaded into the on-chip register. Each bit is programmable and the initialize function can be used to load any desired combination of 1's and 0's into the register. In the unprogrammed state, activating \overline{INIT} will generate a register clear (all outputs LOW). If all the bits of the initialize word are programmed to be a 1, activating \overline{INIT} performs a register preset (all outputs HIGH).

Applying a LOW to the \overline{INIT} input causes an immediate load of the programmed initialize word into the pipeline register and onto the outputs. The \overline{INIT} LOW disables clock and must return HIGH to enable clock independent of all other inputs, including the clock.

Selection Guides

		7C265-15	7C265-25	7C265-40	7C265-50
Minimum Address Set-Up Time (ns)		15	25	40	50
Maximum Clock to Output (ns)		12	15	20	25
Maximum Operating Current (mA)	Com'l	120	120	100	80
	Mil	140	140		120

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature -65°C to $+150^{\circ}\text{C}$
 Ambient Temperature with
 Power Applied -55°C to $+125^{\circ}\text{C}$
 Supply Voltage to Ground Potential -0.5V to $+7.0\text{V}$
 DC Voltage Applied to Outputs
 in High Z State -0.5V to $+7.0\text{V}$
 DC Input Voltage -3.0V to $+7.0\text{V}$
 DC Program Voltage 13.0V
 UV Exposure 7258 Wsec/cm^2
 Static Discharge Voltage $>2001\text{V}$
 (per MIL-STD-883, Method 3015)

Latch-Up Current $>200\text{ mA}$

Operating Range

Range	Ambient Temperature	V_{CC}
Commercial	0°C to $+70^{\circ}\text{C}$	$5\text{V} \pm 10\%$
Industrial ^[1]	-40°C to $+85^{\circ}\text{C}$	$5\text{V} \pm 10\%$
Military ^[2]	-55°C to $+125^{\circ}\text{C}$	$5\text{V} \pm 10\%$

Notes:

1. Contact a Cypress representative for industrial temperature range specifications.
2. T_A is the "instant on" case temperature.

C _{OUT}	Output Capacitance		10	pF

Notes:

- See the last page of this specification for Group A subgroup testing information.
- For test purposes, not more than one output at a time should be shorted. Short circuit test duration should not exceed 30 seconds.
- See Introduction to CMOS PROMs in this Data Book for general information on testing.

Switching Waveform

C265-7

Erase Characteristics

Wavelengths of light less than 4000 Å begin to erase the 7C265 in the windowed package. For this reason, an opaque label should be placed over the window if the PROM is exposed to sunlight or fluorescent lighting for extended periods of time.

The recommended dose of ultraviolet light for erasure is a wavelength of 2537 Å for a minimum dose (UV intensity • exposure time) of 25 Wsec/cm². For an ultraviolet lamp with a 12 mW/cm² power rating the exposure time would be approximately 45 minutes. The 7C265 needs to be within one inch of the lamp during erasure. Permanent damage may result if the PROM is exposed to high-intensity UV light for an extended period of time. 7258 Wsec/cm² is the recommended maximum dosage.

Programming Modes

The 7C265 offers a limited selection of programmed architectures. Programming these features should be done with a single 10-ms-wide pulse in place of the intelligent algorithm, mainly because these features are verified operationally, not with the V_{FF} pin. Architecture programming is implemented by applying the supvoltage to two additional pins during programming. In programming the 7C265 architecture, V_{PP} is applied to pins 3, 9, and 22. The choice of a particular mode depends on the states of the other pins during programming, so it is important that the condi-

Bit Map Data

8192	2000	INIT Byte
8193	2001	Control Byte

Control Byte

- 00 Asynchronous output enable (default condition)
- 01 Synchronous output enable
- 02 Asynchronous initialize

tion of the other pins be met as set forth in the mode table. The considerations that apply with respect to power-up and power-down during intelligent programming also apply during architecture programming. Once the supvoltages have been established and the correct logic states exist on the other device pins, programming may begin. Programming is accomplished by pulling PGM from HIGH to LOW and then back to HIGH with a pulse width equal to 10 ms.
