# 256KB/512KB BurstRAM™

# Secondary Cache Modules for PowerPC™ PReP/CHRP Platforms

The MPC2104P (256KB) and MPC2105P (512KB) are designed to provide burstable, high performance L2 cache for the PowerPC 60x microprocessor family in conformance with the PowerPC Reference Platform (PReP) and the PowerPC Common Hardware Reference Platform (CHRP) specifications.

The MPC2104P and MPC2105P utilize synchronous BurstRAMs. The MPC2104P module is configured as 32K x 64 bits and uses two of the 3.3 V 32K x 32 data RAMs. The MPC2105P is configured as 64K x 64 bits and uses two of the 3.3 V 64K x 32 data RAMs. Both modules are in a 178 (89 x 2) pin DIMM format. For tag bits on the 2104P, a 5 V cache tag RAM configured as 8K x 14 for tag field plus 8K x 2 for valid and dirty status bits is used. For tag bits on the 2105P, a 5 V cache tag RAM configured as 16K x 14 for tag field plus 16K x 2 for valid and dirty status bits is used.

Bursts can be initiated with the ADS signal. Subsequent burst addresses are generated internally to the BurstRAM by the CNTEN signal.

Write cycles are internally self-timed and are initiated by the rising edge of the clock (CLKx) inputs. Writes are global with two inputs for reduced loading.

Presence detect pins are available for auto configuration of the cache control.

The module family pinout will support 5 V and 3.3 V components for a clear path to lower voltage and power savings. Both power supplies must be connected.

All of these cache modules are plug and pin compatible with each other.

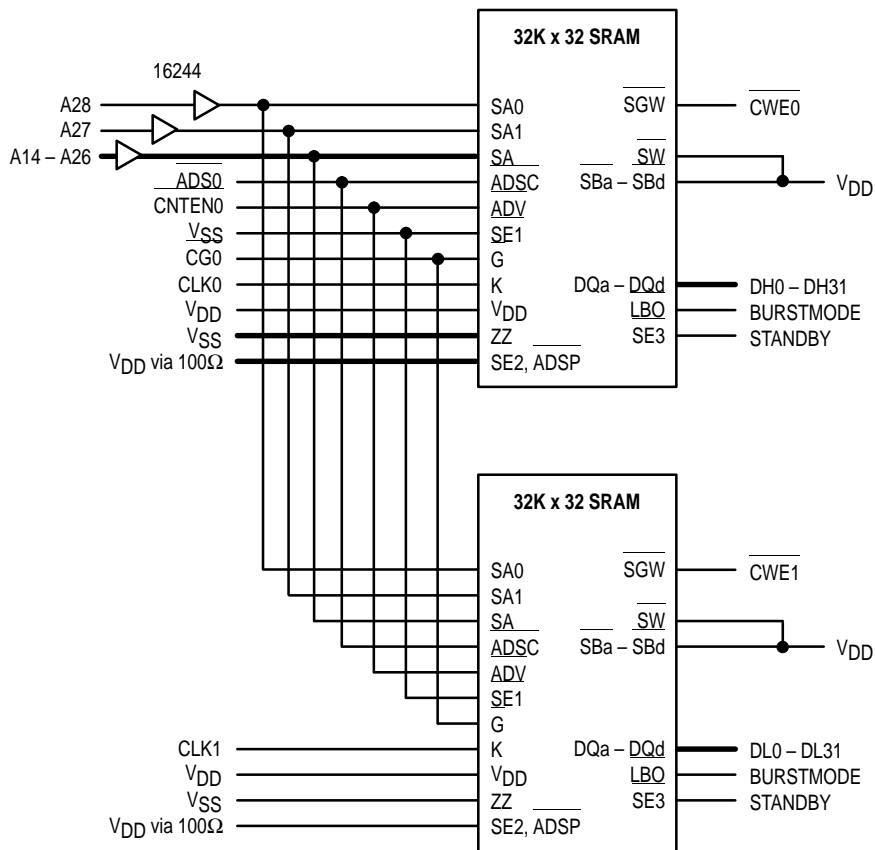

- PowerPC–Style Burst Counter On Chip
- Pipeline Data I/O
- Plug and Pin Compatibility
- Multiple Clock Pins for Reduced Loading
- All Cache Data and Tag I/Os are LVTTTL (3.3 V) Compatible
- Three State Outputs
- Buffered Addresses to Data RAMs for Reduced Loading
- Fast Module Clock Rates: Up to 66 MHz
- Fast SRAM Access Times: 9 ns for Tag RAM Match  
8 ns for Data RAM
- Decoupling Capacitors for Each Fast Static RAM
- High Quality Multi–Layer FR4 PWB With Separate Power and Ground Planes
- 178 Pin Card Edge Module
- Burndy Connector, Part Number: ELF178KSC–3Z50

**NOTES:**

1. X = Don't Care. 1 = logic high. 0 = logic low.
2. CG0 is an asynchronous signal and is not sampled by the clock CLK0. CG0 drives the bus immediately (t<sub>GLQX</sub>) following CG0 going low.
3. On write cycles that follow read cycles, CG0 must be negated prior to the start of the write cycle to ensure proper write data setup times. CG0 must also remain negated at the completion of the write cycle to ensure proper write data hold times.
4. This READ assumes the RAM was previously deselected.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.

This BiCMOS memory circuit has been designed to meet the dc and ac specifications shown in the tables, after thermal equilibrium has been established.

This device contains circuitry that will ensure the output devices are in High-Z at power up.

NOTES:

1. All read and write cycle timings are referenced from CLK or CG0.
2. CG is a don't care when CWE<sub>x</sub> is sampled low.
3. Maximum access times are guaranteed for all possible PowerPC external bus cycles.
4. This is a synchronous device. All addresses must meet the specified setup and hold times for **ALL** rising edges of CLK whenever ADS0 is low, and the chip is selected. All other synchronous inputs must meet the specified setup and hold times for **ALL** rising edges of CLK when the chip is enabled. Chip enable must be valid at each rising edge of clock for the device (when ADS0 is low) to remain enabled.

### TIMING LIMITS

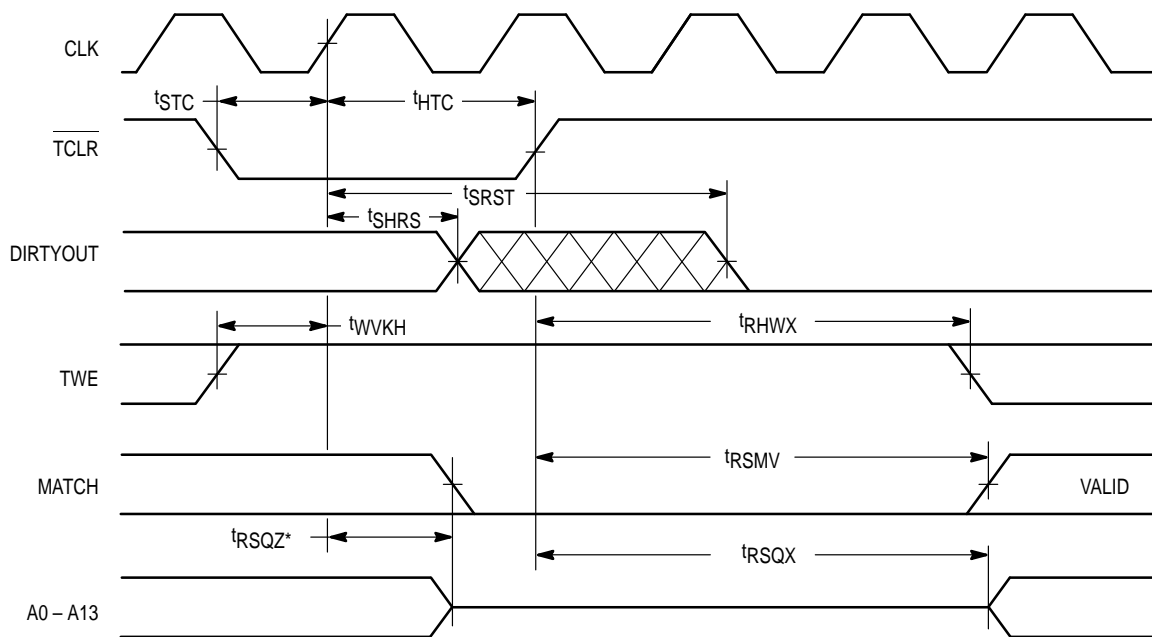

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address setup time is shown as a minimum since the system must supply at least that much time. On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.

### TAG RAM MATCH CYCLE

\*Cache addresses used are: A14 - A26 for MPC2104P.

### TAG RAM TCLR FUNCTION

\* Transition is measured plus or minus 200 mV from steady state.

### ORDERING INFORMATION (Order by Full Part Number)

Full Part Numbers — MPC2104PDG66    MPC2104P = 256KB, synchronous pipelined  
MPC2105PDG66    MPC2105P = 512KB, synchronous pipelined
