## DC-12 GHz Packaged High Efficiency Divide-by-2 Prescaler

HMMC-3122-TR1 - 7" diameter reel/500 each  
HMMC-3122-BLK - Bubble strip/10 each  
Data Sheet

### Description

The HMMC-3122 is a packaged GaAs HBT MMIC prescaler which offers DC to 12 GHz frequency translation for use in communications and EW systems incorporating high-frequency PLL oscillator circuits and signal-path down conversion applications. The prescaler provides a large input power sensitivity window and low phase noise.

Package Type: SOIC-8 Plastic  
Package Dimensions: 4.9 x 3.9 mm typ  
Package Thickness: 1.55 mm typ  
Lead Pitch: 1.25 mm nom  
Lead Width: 0.42 mm nom

### Features

- **Wide Frequency Range:**  
0.2–12 GHz
- **High Input Power Sensitivity:**  
On-chip pre- and post-amps  
-15 to +10 dBm (1–8 GHz)  
-10 to +8 dBm (8–10 GHz)  
-5 to +2 dBm (10–12 GHz)
- **P<sub>out</sub>: 0 dBm (0.5 V<sub>p-p</sub>)**
- **Low Phase Noise:**  
-153 dBc/Hz @ 100 kHz Offset
- **(+) or (-) Single Supply Bias Operation**
- **Wide Bias Supply Range:**  
4.5 to 6.5 volt operating range
- **Differential I/O with on-chip 50Ω matching**

### Absolute Maximum Ratings<sup>1</sup>

(@ T<sub>A</sub> = +25 °C, unless otherwise stated)

Symbol	Parameters/Conditions	Min	Max	Units
V <sub>CC</sub>	Bias Supply Voltage		+7	volts
V <sub>EE</sub>	Bias Supply Voltage	-7		volts
V <sub>CC</sub> - V <sub>EE</sub>	Bias Supply Delta		+7	volts
V <sub>Logic</sub>	Logic Threshold Voltage	V <sub>CC</sub> - 1.5	V <sub>CC</sub> - 1.2	volts
P <sub>in(CW)</sub>	CW RF Input Power		+10	dBm
V <sub>RFin</sub>	DC Input Voltage (@ RFin or $\overline{\text{RFin}}$ Ports)		V <sub>CC</sub> ±0.5	volts
T <sub>BS</sub> <sup>2</sup>	Backside Operating Temperature	-40	+85	°C
T <sub>st</sub>	Storage Temperature	-65	+165	°C
T <sub>max</sub>	Maximum Assembly Temperature (60 seconds max)		310	°C

### Notes:

1. Operation in excess of any parameter limit (except T<sub>BS</sub>) may cause permanent damage to the device.
2. MTTF > 1 x 10<sup>6</sup> hours @ T<sub>BS</sub> ≤ 85°C. Operation in excess of maximum operating temperature (T<sub>BS</sub>) will degrade MTTF.

### Notes:

- For sine-wave input signal. Prescaler will operate down to dc for square-wave input signal. Min. divide frequency limited by input slew rate.
- Prescaler can exhibit this output signal under bias in the absence of an RF input signal. This condition can be eliminated by use of the Input dc offset technique described on page 4.
- Fundamental of output square wave's Fourier Series.
- Square wave amplitude calculated from  $P_{out}$ .

The HMMC-3122 is designed for use in high frequency communications, microwave instrumentation, and EW radar systems where low phase-noise PLL control circuitry or broadband frequency translation is required.

The device is designed to operate when driven with either a single-ended or differential sinusoidal input signal over a 200 MHz to 12 GHz bandwidth. Below 200 MHz the prescaler input is “slew-rate” limited, requiring fast rising and falling edge speeds to properly divide. The device will operate at frequencies down to dc when driven with a square-wave.

For positive supply operation,  $V_{CC}$  pins are nominally biased at any voltage in the +4.5 to +6.5 volt range with pin 8 ( $V_{EE}$ ) grounded. For negative bias operation  $V_{CC}$  pins are typically grounded and a negative voltage between -4.5 to -6.5 volts is applied to pin 8 ( $V_{EE}$ ).

All RF ports are dc connected on-chip to the  $V_{CC}$  contact through on-chip  $50\Omega$  resistors. Under any bias conditions where  $V_{CC}$  is not dc grounded the RF ports should be ac coupled via series capacitors mounted on the PC-board at each RF port. Only under bias conditions where  $V_{CC}$  is dc grounded (as is typical for negative bias supply operation) may the RF ports be direct coupled to adjacent circuitry or in some cases, such as level shifting to subsequent stages. In the latter case the package heat sink may be “floated” and bias applied as the difference between  $V_{CC}$  and  $V_{EE}$ .

If an RF signal with sufficient signal to noise ratio is present at the RF input lead, the prescaler will operate and provide a divided output equal the input frequency divided by the divide modulus. Under certain “ideal” conditions where the input is well matched at the right input frequency, the component may “self-oscillate”, especially under small signal input powers or with only noise present at the input. This “self-oscillation” will produce an undesired output signal also known as a false trigger. To prevent false triggers or self-oscillation conditions, apply a 20 to 100 mV dc offset voltage between the RFin and  $\overline{\text{RFin}}$  ports. This prevents noise or spurious low level signals from triggering the divider.

Adding a 10K $\Omega$  resistor between the unused RF input to a contact point at the VEE potential will result in an offset of » 25mV between the RF inputs. Note, however, that the input sensitivity will be reduced slightly due to the presence of this offset.

## Assembly Notes

Independent of the bias applied to the package, the backside of the package should always be connected to both a good RF ground plane and a good thermal heat sinking region on the PC-board to optimize performance. For single-ended output operation the unused RF output lead should be terminated into  $50\Omega$  to a contact point at the  $V_{CC}$  potential or to RF ground through a dc blocking capacitor.

A minimum RF and thermal PC board contact area equal to or greater than  $2.67 \times 1.65$  mm ( $0.105" \times 0.065"$ ) with eight  $0.020"$  diameter plated-wall thermal vias is recommended.

MMIC ESD precautions, handling considerations, die attach and bonding methods are critical factors in successful GaAs MMIC performance and reliability.

Agilent application note #54, "GaAs MMIC ESD, Die Attach and Bonding Guidelines" provides basic information on these subjects.
