

Low Power, Rail-to-Rail Output, Video Op Amp with Ultralow Power Disable

ADA4853-1/ADA4853-2/ADA4853-3

FEATURES

- Ultralow power-down current: 0.1 μ A**
- Low quiescent current: 1.4 mA/amplifier**
- Ideal for standard definition video**
- High speed**
 - 100 MHz, -3 dB bandwidth
 - 120 V/ μ s slew rate
- 0.5 dB flatness: 22 MHz**
- Differential gain: 0.20%**
- Differential phase: 0.10°**
- Single-supply operation**
- Rail-to-rail output**
 - Output swings to within 200 mV of either rail
- Low voltage offset: 1 mV**
- Wide supply range: 2.65 V to 5 V**

APPLICATIONS

- Portable multimedia players
- Video cameras
- Digital still cameras
- Consumer video

GENERAL DESCRIPTION

The ADA4853-1/ADA4853-2/ADA4853-3 are low power, low cost, high speed, rail-to-rail output op amps with ultralow power disable that are ideal for portable consumer electronics. Despite their low price, the ADA4853-1/ADA4853-2/ADA4853-3 provide excellent overall performance and versatility. The 100 MHz, -3 dB bandwidth and 120 V/ μ s slew rate make these amplifiers well-suited for many general-purpose, high speed applications.

The ADA4853-1/ADA4853-2/ADA4853-3 voltage feedback op amps are designed to operate at supply voltages as low as 2.65 V and up to 5 V using only 1.4 mA of supply current per amplifier. To further reduce power consumption, the amplifiers are equipped with a power-down mode that lowers the supply current to less than 1.5 μ A maximum, making them ideal in battery-powered applications.

The ADA4853-1/ADA4853-2/ADA4853-3 provide users with a true single-supply capability, allowing input signals to extend 200 mV below the negative rail and to within 1.2 V of the positive rail. On the output, the amplifiers can swing within 200 mV of either supply rail.

PIN CONFIGURATIONS

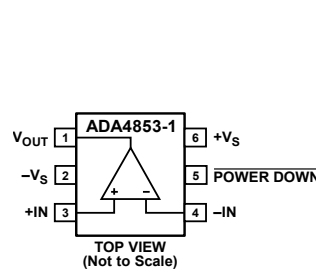

Figure 1. 6-Lead SC70

Figure 2. 16-Lead LFCSP_VQ

Figure 3. 16-Lead LFCSP_VQ

Figure 4. 16-Lead TSSOP

With their combination of low price, excellent differential gain (0.2%), differential phase (0.10°), and 0.5 dB flatness out to 22 MHz, these amplifiers are ideal for video applications.

The ADA4853-1 is available in a 6-lead SC70, the ADA4853-2 is available in a 16-lead LFCSP_VQ, and the ADA4853-3 is available in both a 16-lead LFCSP_VQ and a 14-lead TSSOP. The ADA4853-1 temperature range is -40°C to $+85^{\circ}\text{C}$, while the ADA4853-2/ADA4853-3 temperature range is -40°C to $+105^{\circ}\text{C}$.

ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
Supply Voltage	5.5 V
Power Dissipation	See Figure 6
Common-Mode Input Voltage	$-V_S - 0.2\text{ V}$ to $+V_S - 1.2\text{ V}$
Differential Input Voltage	$\pm V_S$
Storage Temperature Range	-65°C to $+125^\circ\text{C}$
Operating Temperature Range	
6-Lead SC70	-40°C to $+85^\circ\text{C}$
16-Lead LFCSP_VQ	-40°C to $+105^\circ\text{C}$
14-Lead TSSOP	-40°C to $+105^\circ\text{C}$
Lead Temperature	JEDEC J-STD-20
Junction Temperature	150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, θ_{JA} is specified for the device soldered in the circuit board for surface-mount packages.

Table 4.

Package Type	θ_{JA}	Unit
6-Lead SC70	430	$^\circ\text{C}/\text{W}$
16-Lead LFCSP_VQ	63	$^\circ\text{C}/\text{W}$
14-Lead TSSOP	120	$^\circ\text{C}/\text{W}$

Maximum Power Dissipation

The maximum safe power dissipation for the ADA4853-1/ADA4853-2/ADA4853-3 is limited by the associated rise in junction temperature (T_j) on the die. At approximately 150°C , which is the glass transition temperature, the plastic changes its properties. Even temporarily exceeding this temperature limit can change the stresses that the package exerts on the die, permanently shifting the parametric performance of the amplifiers. Exceeding a junction temperature of 150°C for an extended period can result in changes in silicon devices, potentially causing degradation or loss of functionality.

The power dissipated in the package (P_D) for a sine wave and a resistor load is the total power consumed from the supply minus the load power.

$$P_D = \text{Total Power Consumed} - \text{Load Power}$$

$$P_D = \left(V_{\text{SUPPLY VOLTAGE}} \times I_{\text{SUPPLY CURRENT}} \right) - \frac{V_{\text{OUT}}^2}{R_L}$$

RMS output voltages should be considered.

Airflow increases heat dissipation, effectively reducing θ_{JA} . In addition, more metal directly in contact with the package leads and through holes under the device reduces θ_{JA} .

Figure 6 shows the maximum safe power dissipation in the package vs. the ambient temperature for the 6-lead SC70 ($430^\circ\text{C}/\text{W}$), the 14-lead TSSOP ($120^\circ\text{C}/\text{W}$), and the 16-lead LFCSP_VQ ($63^\circ\text{C}/\text{W}$) on a JEDEC standard 4-layer board. θ_{JA} values are approximations.

Figure 6. Maximum Power Dissipation vs. Temperature for a 4-Layer Board

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

ADA4853-1/ADA4853-2/ADA4853-3

CIRCUIT DESCRIPTION

The ADA4853-1/ADA4853-2/ADA4853-3 feature a high slew rate input stage that is a true single-supply topology capable of sensing signals at or below the minus supply rail. The rail-to-rail output stage can pull within 100 mV of either supply rail when driving light loads and within 200 mV when driving 150 Ω . High speed performance is maintained at supply voltages as low as 2.65 V.

HEADROOM CONSIDERATIONS

The ADA4853-1/ADA4853-2/ADA4853-3 are designed for use in low voltage systems. To obtain optimum performance, it is useful to understand the behavior of the amplifiers as input and output signals approach their headroom limits. The amplifiers' input common-mode voltage range extends from the negative supply voltage (actually 200 mV below this) to within 1.2 V of the positive supply voltage.

Exceeding the headroom limits is not a concern for any inverting gain on any supply voltage, as long as the reference voltage at the amplifiers' positive input lies within the amplifiers' input common-mode range.

The input stage is the headroom limit for signals approaching the positive rail. Figure 50 shows a typical offset voltage vs. the input common-mode voltage for the ADA4853-1/ADA4853-2/ADA4853-3 on a 5 V supply. Accurate dc performance is maintained from approximately 200 mV below the negative supply to within 1.2 V of the positive supply. For high speed signals, however, there are other considerations. As the common-mode voltage gets within 1.2 V of positive supply, the amplifier responds well but the bandwidth begins to drop as the common-mode voltage approaches the positive supply. This can manifest itself in increased distortion or settling time. Higher frequency signals require more headroom than the lower frequencies to maintain distortion performance.

Figure 50. V_{OS} vs. Common-Mode Voltage, $V_S = 5$ V

For signals approaching the negative supply and inverting gain and high positive gain configurations, the headroom limit is the output stage. The ADA4853-1/ADA4853-2/ADA4853-3 use a common-emitter output stage. This output stage maximizes the available output range, limited by the saturation voltage of the output transistors. The saturation voltage increases with the drive current that the output transistor is required to supply due to the output transistor's collector resistance.

As the saturation point of the output stage is approached, the output signal shows increasing amounts of compression and clipping. As in the input headroom case, higher frequency signals require a bit more headroom than the lower frequency signals. Figure 27 illustrates this point by plotting the typical distortion vs. the output amplitude.

OVERLOAD BEHAVIOR AND RECOVERY

Input

The specified input common-mode voltage of the ADA4853-1/ADA4853-2/ADA4853-3 is 200 mV below the negative supply to within 1.2 V of the positive supply. Exceeding the top limit results in lower bandwidth and increased rise time. Pushing the input voltage of a unity-gain follower to less than 1.2 V from the positive supply leads to an increasing amount of output error as well as increased settling time. The recovery time from input voltages 1.2 V or closer to the positive supply is approximately 40 ns; this is limited by the settling artifacts caused by transistors in the input stage coming out of saturation.

The amplifiers do not exhibit phase reversal, even for input voltages beyond the voltage supply rails. Going more than 0.6 V beyond the power supplies turns on protection diodes at the input stage, greatly increasing the current draw of the devices.

APPLICATIONS

SINGLE-SUPPLY VIDEO AMPLIFIER

With low differential gain and phase errors and wide 0.5 dB flatness, the ADA4853-1/ADA4853-2/ADA4853-3 are ideal solutions for portable video applications. Figure 51 shows a typical video driver set for a noninverting gain of +2, where $R_F = R_G = 1\text{ k}\Omega$. The video amplifier input is terminated into a shunt $75\ \Omega$ resistor. At the output, the amplifier has a series $75\ \Omega$ resistor for impedance matching to the video load.

When operating in low voltage, single-supply applications, the input signal is only limited by the input stage headroom.

Figure 51. Video Amplifier

POWER SUPPLY BYPASSING

Attention must be paid to bypassing the power supply pins of the ADA4853-1/ADA4853-2/ADA4853-3. High quality capacitors with low equivalent series resistance (ESR), such as multilayer ceramic capacitors (MLCCs), should be used to minimize supply voltage ripple and power dissipation. A large, usually tantalum, $2.2\ \mu\text{F}$ to $47\ \mu\text{F}$ capacitor located in proximity to the ADA4853-1/ADA4853-2/ADA4853-3 is required to provide good decoupling for lower frequency signals. The actual value is determined by the circuit transient and frequency requirements. In addition, $0.1\ \mu\text{F}$ MLCC decoupling capacitors should be located as close to each of the power supply pins as is physically possible, no more than $\frac{1}{8}$ inch away. The ground returns should terminate immediately into the ground plane. Locating the bypass capacitor return close to the load return minimizes ground loops and improves performance.

LAYOUT

As is the case with all high speed applications, careful attention to printed circuit board (PCB) layout details prevents associated board parasitics from becoming problematic. The ADA4853-1/ADA4853-2/ADA4853-3 can operate up to 100 MHz; therefore, proper RF design techniques must be employed. The PCB should have a ground plane covering all unused portions of the component side of the board to provide a low impedance return path. Removing the ground plane on all layers from the area near and under the input and output pins reduces stray capacitance. Signal lines connecting the feedback and gain resistors should be kept as short as possible to minimize the inductance and stray capacitance associated with these traces. Termination resistors and loads should be located as close as possible to their respective inputs and outputs. Input and output traces should be kept as far apart as possible to minimize coupling (crosstalk) through the board. Adherence to microstrip or stripline design techniques for long signal traces (greater than 1 inch) is recommended. For more information on high speed board layout, go to: www.analog.com to view *A Practical Guide to High-Speed Printed-Circuit-Board Layout*.
