

HORIZONTAL AND VERTICAL DEFLECTION MONITOR

- DIRECT FRAME YOKE DRIVE $\pm 1.5A$ DRIVING CURRENT
- LINE DARLINGTON DRIVING CAPABILITY
- BUILT-IN FRAME SEPARATOR WITHOUT EXTERNAL COMPONENTS
- INTEGRATED FLYBACK GENERATOR
- FRAME OUTPUT PROTECTION AGAINST SHORT CIRCUITS
- VERY FEW EXTERNAL COMPONENTS
- HIGH DISSIPATION POWER PACKAGE
- SEPARATE POWER GROUND
- HORIZONTAL OSCILLATOR FREQUENCY RANGE FROM 15kHz TO 100kHz
- VERTICAL OSCILLATOR FREQUENCY RANGE FROM 30Hz TO 120Hz

MULTIWATT 15
(Plastic Package)

ORDER CODE : TDA2117

GENERAL DESCRIPTION

The TEA2117 performs all of the video and power functions required to provide signals for the direct drive of a line darlington and the frame yoke.

It contains :

- A synchronizing separator with the slice level of synchro separation determined by the external components.
- An integrated frame synchronizing separator without external components.
- A saw tooth generator for the frame with synchronization allowed during the last fourth of the free run period.
- A power amplifier for direct drive of the frame yoke with overload, short circuit and thermal protections.
- A line phase detector and a voltage control oscillator.
- An open collector output for the direct drive of a line darlington.
- Separate power ground (Pin 8)

SYNCHRONIZATION SEPARATOR CIRCUIT
(Figure 1)

The sync-tip DC level on pin 7 is clamped to 3.8V. The slice level of sync-separation present on capacitor C1 depends on the value of resistor R1 and R2. When the video signal on pin 7 decreases under the capacitor voltage the transistors Q1 and Q2 provide current for the other parts of the circuit.

FRAME SEPARATOR (Figure 2)

The sync-pulse allows the discharge of the capacitor by a $2 \times I$ current. A line sync-pulse is not able to discharge the capacitor under $V_Z/2$. A frame sync-pulse permits the complete discharge of the capacitor, so during the frame sync-pulse Q3 and Q4 provide current for the other parts of the circuit.

LINE OSCILLATOR (Figure 3)

The oscillator thresholds are internally fixed by resistors. The discharge of the capacitor depends on the internal resistor R4. The voltage control is applied on resistor R5.

PHASE COMPARATOR (Figure 4)

The sync-pulse drives the current in the comparator. The line flyback integrated by the external network gives on pin 3 a saw tooth, the DC offset of this saw tooth is fixed by VC. The comparator output provides a positive current for the part of the signal on pin 3 superior to VC and a negative current for the other part. When the line flyback and the video signal are synchronized, the output of the comparator is an alternately negative and positive current. The frame sync-pulse inhibits the comparator to prevent frequency drift of the line oscillator on the frame beginning. (see Figure 5)

LINE OUTPUT (Pin1)

It is an open collector output which is able to drive pulse current of 500mA for a rapid discharging of the darlington base. The output pulse time is $22\mu\text{s}$ for a $64\mu\text{s}$ period.

FRAME OSCILLATOR (Figure 6)

The oscillator thresholds are internally fixed by resistors. The oscillator is synchronized during the last fourth of the free run period. The input current during the charge of the capacitor is less than 100nA.

FRAME OUTPUT AMPLIFIER

This amplifier is able to drive directly the frame yoke. Its output is short circuit and overload protected ; it contains also a thermal protection. Its positive input is directly connected to the invert of the frame saw tooth.
