Description

The Hitachi HN29WT800 Series, HN29WB800 Series are 1-Mword $\times$ 8-bit/512-kword $\times$ 16-bit CMOS Flash Memory with DINOR (Divided bitline NOR) type memory cells, that realize programming and erase capabilities with a single 3.3 V power supply. The built-in Sequence Controller allows Automatic Program/Erase without complex external control. HN29WT800 Series, HN29WB800 Series enable the low power and high performance systems such as mobile, personal computing and communication products.

Features

- On-board single power supply (V_{CC}): $V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$
- Access time: 80/100/120 ns (max)
- Low power dissipation:
 - $I_{CC} = 30 \text{ mA}$ (max) (Read)
 - $I_{CC} = 200 \mu\text{A}$ (max) (Standby)
 - $I_{CC} = 40 \text{ mA}$ (max) (Program)
 - $I_{CC} = 40 \text{ mA}$ (max) (Erase)
 - $I_{CC} = 1 \mu\text{A}$ (type) (Deep powerdown)
- Automatic page programming:
 - Programming time: 25 ms (type)
 - Program unit: 128 word
- Automatic erase:
 - Erase time: 50 ms (type)
 - Erase unit: Boot block; 8-kword/16-kbyte $\times$ 1

Parameter block; 4-kword/8-kbyte $\times$ 2

Main block; 16-kword/32-kbyte $\times$ 1

32-kword/64-kbyte $\times$ 15

This product is compatible with M5M29FB/T800xx by Ltd. Mitsubishi.

■ 4496203 0033828 3T4 ■

1

HN29WT800 Series, HN29WB800 Series

- Block boot:
 - HN29WT800 Series: Top boot
 - HN29WB800 Series: Bottom boot
- Program/Erase endurance
 - 10,000 cycles
- Other functions:
 - Software command control
 - Selective block lock
 - Program suspend/Resume
 - Erase suspend/Resume
 - Status register read
- Compatible with M5M29FB/T800xx by Ltd. Mitsubishi

	Status register	V_{IL}	V_{IL}	V_{IH}	V_{IH}	$\times^{*5}$	Status Register Data
	Lock bit status	V_{IL}	V_{IL}	V_{IH}	V_{IH}	$\times$	Lock bit data (I/O6)
	Identifier (Maker) ^{*1, *2}	V_{IL}	V_{IL}	V_{IH}	V_{IH}	V_{OH} (High-Z)	07H
	Identifier (Device) ^{*1, *3}	V_{IL}	V_{IL}	V_{IH}	V_{IH}	V_{OH} (High-Z)	85H / 86H ^{*6}
Output disable		V_{IL}	V_{IH}	V_{IH}	V_{IH}	$\times$	High-Z
Standby		V_{IH}	$\times^{*5}$	$\times^{*5}$	V_{IH}	$\times$	High-Z
Command write ^{*4}	Program	V_{IL}	V_{IH}	V_{IL}	V_{IH}	$\times$	Command/Data in
	Erase	V_{IL}	V_{IH}	V_{IL}	V_{IH}	$\times$	Command
	Others	V_{IL}	V_{IH}	V_{IL}	V_{IH}	$\times$	Command
Deep powerdown		$\times$	$\times$	$\times$	V_{IL}	V_{OH} (High-Z)	High-Z

- Notes: 1. The command programming mode is used to output the identifier code. Refer to the table of Software Command Definition.
2. $A0 = V_{\text{IL}}$
3. $A0 = V_{\text{IH}}$
4. Refer to the table of Software Command Definition. Programming and erase operation begins after mode setting by command input.
5. $\times$ can be V_{IL} or V_{IH} for control pins, and V_{OL} or V_{OH} (High-Z) for $\text{RDY}/\overline{\text{Busy}}$ pin. The $\text{RDY}/\overline{\text{Busy}}$ is an open drain output pin and indicates status of the internal WSM. When low, it indicates the WSM is Busy performing an operation. A pull-up resistor of 10 k to 100 k Ω is required to allow the $\text{RDY}/\overline{\text{Busy}}$ signal to transition high indicating a Ready WSM condition.

Software Command Definition

Command	First bus cycle			Second bus cycle			Third bus cycle		
	Operation mode	Address	Data (I/O7 to I/O0)* ¹	Operation mode	Address	Data (I/O7 to I/O0)	Operation mode	Address	Data (I/O7 to I/O0)
Read array (memory)	Write	×	FFH						
Read identifier codes	Write	×	90H	Read	IA* ²	ID* ²			
Read status register	Write	×	70H	Read	×	SRD* ³			
Clear status register	Write	×	50H						
Page program* ⁵	Write	×	41H	Write	WA0* ⁴	WD0* ⁴	Write	WA1	WD1
Block erase	Write	×	20H	Write	BA* ⁶	D0H			
Suspend	Write	×	B0H						
Resume	Write	×	D0H						
Read lock bit status	Write	×	71H	Read	BA	I/O6* ⁷			
Lock bit program/confirm	Write	×	77H	Write	BA	D0H			
Erase all unlocked blocks	Write	×	A7H	Write	×	D0H			

- Notes:
1. In the word mode, upper byte data (I/O8 to I/O15) is ignored.
 2. IA = Identifier address, A0 = V_{IL} (Manufacture code), A0 = V_{IH} (Device code), ID = ID code, BYTE = V_{IL}: A-1, A1 to A18 = V_{IL}, BYTE = V_{IH}: A1 to A18 = V_{IL}.
 3. SRD = Status register data
 4. WA = Write address, WD = Write data
 5. BYTE = V_{IL}: Write address and write data must be provided sequentially from 00H to FFH for A-1 to A6. Page size is 256 byte (256-byte × 8-bit).
 BYTE = V_{IH}: Write address and write data must be provided sequentially from 00H to 7FH for A0 to A6. Page size is 128 word (128-word × 16-bit).
 6. BA = Block address (A12 to A18), (Addresses except block address must be V_{IH})
 7. I/O6 provides block lock status, I/O6 = 1: Block unlocked, I/O6 = 0: Block locked.

HN29WT800 Series, HN29WB800 Series

Block Locking

$\overline{RP}$	$\overline{WP}$	Lock bit (internally)	Write protection provided
V_{IL}	X	X	All blocks locked (Deep powerdown mode)
V_{HH}	X	X	All blocks unlocked
V_{IH}	V_{IL}	0	Blocks locked (Depend on lock bit data)
V_{IH}	V_{IL}	1	Blocks unlocked (Depend on lock bit data)
V_{IH}	V_{IH}	X	All blocks unlocked

Note: I/O6 provided lock status of each block after writing the Read lock status command (71H). $\overline{WP}$ pin must not be switched during performing Read/Write operations or WSM busy (WSMS = 0).

Status Register Data (SRD)

Symbol	Function	Definition
SR. 7 (I/O7)	Write state machine status	1 = Ready 0 = Busy
SR. 6 (I/O6)	Suspend status	1 = Suspend 0 = Operation in progress/completed
SR. 5 (I/O5)	Erase status	1 = Error 0 = Successful
SR. 4 (I/O4)	Program status	1 = Error 0 = Successful
SR. 3 (I/O3)	Block status after program	1 = Error 0 = Successful
SR. 2 (I/O2)	Reserved	The function and the definition for these bits are to be determined. These bits should be masked out when the status register is polled.
SR. 1 (I/O1)	Reserved	
SR. 0 (I/O0)	Reserved	

Note: The RDY/Busy is an open drain output pin and indicates status of the internal WSM. When low, it indicates that the WSM is Busy performing an operation. A pull-up resistor of 10k Ω to 100k Ω is required to allow the RDY/Busy signal to transition high indicating a Ready WSM condition.
I/O3 indicates the block status after the page programming. When I/O3 is High, the page has the over-programmed cell. If over-program occurs, the device is block failed. However, if I/O3 is High, please try the block erase to the block. The block may revive.

HN29WT800 Series, HN29WB800 Series

Device Identifier Mode

The device identifier mode allows the reading out of binary codes that identify manufacturer and type of device, from outputs of Flash Memory. By this mode, the device will be automatically matched its own corresponding erase and programming algorithm.

HN29WT800 Series, HN29WB800 Series Identifier Code

Pins	A0	I/O7	I/O6	I/O5	I/O4	I/O3	I/O2	I/O1	I/O0	Hex. data
Manufacturer code	0	0	0	0	0	0	1	1	1	07H
Device code (T series)	1	1	0	0	0	0	1	0	1	85H
Device code (B series)	1	1	0	0	0	0	1	1	0	86H

- Notes:
1. Device identifier code can be read out by using the read identified codes command.
 2. In the word mode, the same data as I/O7 to I/O0 is read out from I/O15 to I/O8.
 3. $A9 = V_{IH}$ mode. $A9 = 11.5\text{ V}$ to 13.0 V . Set $A9$ to V_{IH} min 200 ns before falling edge of $\overline{CE}$ in ready status. Min 200 ns after return to V_{IH} , device can't be accessed. $A1$ to $A8$, $A10$ to $A18$, $\overline{CE}$, $\overline{OE}$, $= V_{IL}$, $\overline{WE} = V_{IH}$, $I/O15/A-1 = V_{IL}$ (BYTE = L).

Operations of the HN29WT800 Series, HN29WB800 Series

The HN29WT800 Series, HN29WB800 Series include on-chip program/erase control circuitry. The Write State Machine (WSM) controls block erase and page program operations. Operational modes are selected by the commands written to the Command User Interface (CUI). The Status Register indicates the status of the WSM and when the WSM successfully completes the desired program or block erase operation. A Deep Powerdown mode is enabled when the $\overline{RP}$ pin is at V_{SS} minimizing power consumption.

Read: The HN29WT800 Series, HN29WB800 Series have three read modes, which accesses to the memory array, the Device Identifier and the Status Register. The appropriate read command are required to be written to the CUI. Upon initial device powerup or after exit from deep powerdown, the HN29WT800 Series, HN29WB800 Series automatically reset to read array mode. In the read array mode, low level input to $\overline{CE}$ and $\overline{OE}$, high level input to $\overline{WE}$ and $\overline{RP}$, and address signals to the address inputs ($A0$ to $A18$) output the data of the addressed location to the data input/output ($I/O0$ to $I/O15$).

Write: Writes to the CUI enable reading of memory array data, device identifiers and reading and clearing of the Status Register, they also enable block erase and program. The CUI is written by bringing $\overline{WE}$ to low level, while $\overline{CE}$ is at low level and $\overline{OE}$ is at high level. Addresses and data are latched on the earlier rising edge of $\overline{WE}$ and $\overline{CE}$. Standard micro-processor write timings are used.

Output Disable: When $\overline{OE}$ is at V_{IH} , output from the device is disabled. Data input/output are in a high impedance (High-Z) state.

HN29WT800 Series, HN29WB800 Series

Standby: When $\overline{CE}$ is at V_{IH} , the device is in the standby mode and its power consumption is reduced. Data input/output are in a high impedance (High-Z) state. If the memory is deselected during block erase or program, the internal control circuits remain active and the device consume normal active power until the operation completes.

Deep Powerdown: When $\overline{RP}$ is at V_{IL} , the device is in the deep powerdown mode and its power consumption is substantially low. During read modes, the memory is deselected and the data input/output are in a high impedance (High-Z) state. After return from powerdown, the CUI is reset to Read Array and the Status Register is cleared to value 80H. During block erase or program modes, $\overline{RP}$ low will abort either operation. Memory array data of the block being altered become invalid.

Functional Description

The device operations are selected by writing specific software command into the CUI.

Read Array Command (FFH): The device is in read array mode on initial device power up and after exit from deep power down, or by writing FFH to the CUI. The device remains in Read Array mode until the other commands are written.

Read Device Identifier Command (90H): Though PROM programmers can normally read device identifier codes by raising A9 to high voltage, multiplexing high voltage onto address lines is not desired for micro-processor system. It is an other means to read device identifier codes that Read Device Identifier Code Command (90H) is written to the command latch. Following the write of the Read Device Identifier command of 90H, the manufacturer code and the device code can be read from addresses 00000H and 00001H, respectively.

Read Status Register Command (70H): The Status Register is read after writing the read status register command of 70H to the CUI. The contents of Status Register are latched on the later falling edge of $\overline{OE}$ or $\overline{CE}$. So $\overline{CE}$ or $\overline{OE}$ must be toggled every status read.

Clear Status Register Command (50H): The Erase Status and Program Status bits are set to High by the Write State Machine and can be reset by the Clear Status Register command of 50H. These bits indicates various failure conditions.

Block Erase/Confirm Command (20H/D0H): Automated block erase is initiated by writing the Block Erase of 20H followed by the Confirm command of D0H. An address within the block to be erased is required. The WSM executes iterative erase pulse application and erase verify operation.

Suspend/Resume Command (B0H/D0H): Writing the suspend command of B0H during block erase operation interrupts the block erase operation and allows read out from another block of memory. Writing the suspend command of B0H during program operation interrupts the program operation and allows read out from another block of memory. The device continues to output status register data when read, after the suspend command is written to it. Polling the WSM status and suspend status bits will determine when the erase operation or program operation has been suspended. At this point, writing of the read array command to the CUI enables reading data from blocks other than that which is suspended. When the resume command of D0H is written to the CUI, the WSM will continue with the erase or program processes.

HN29WT800 Series, HN29WB800 Series

Page Program Command (41H): Page program allows fast programming of 128-word of data. Writing of 41H initiates the page program operation. From 2nd cycle to 129th cycle write data must be serially inputted. Address A6 to A0 have to be incremented from 00H to 7FH. After completion of data loading, the WSM controls the program pulse application and verify operation. Basically re-program must not be done on a page which has already programmed.

Data Protection: The HN29WT800 Series, HN29WB800 Series provide selective block locking of memory blocks. Each block has an associated nonvolatile lock-bit which determines the lock status of the block. In addition, the HN29WT800 Series, HN29WB800 Series have a master write protect pin ($\overline{WP}$) which prevents any modifications to memory blocks whose lock-bits are set to Low, when $\overline{WP}$ is low. When $\overline{WP}$ is high or $\overline{RP}$ is V_{HH} , all blocks can be programmed or erased regardless of the state of lock-bits, and the lock-bits are cleared to High by erase.

Power Supply Voltage: A delay time of 2 μ s is required before any device operation is initiated. The delay time is measured from the time V_{CC} reaches $V_{CC\ min}$ (3.0 V). During powerup, $\overline{RP} = V_{SS}$ is recommended. Falling in Busy status is not recommended for possibility of damaging the device.

Absolute Maximum Ratings

Parameter	Symbol	Value	Unit	Notes
V_{CC} voltage	V_{CC}	-0.2 to +4.6	V	1
All input and output voltages except V_{CC} , A9, $\overline{RP}$	V_{in}, V_{out}	-0.6 to +4.6	V	1, 2
A9, $\overline{RP}$ supply voltage	V_{HH}, V_{ID}	-0.6 to +14.0	V	1, 2
Operating temperature range	T_{opr}	0 to +70	$^{\circ}C$	
Storage temperature range	T_{stg}	-65 to +125	$^{\circ}C$	
Storage temperature under bias	T_{bias}	-10 to +80	$^{\circ}C$	

Notes: 1. Relative to V_{SS} .

2. Minimum DC voltage is -0.5 V on input/output pins. During transition, this level may undershoot to -2.0 V for periods < 20 ns. Maximum DC voltage on input/output pins are $V_{CC} + 0.5$ V which, during transitions, may overshoot to $V_{CC} + 1.5$ V for periods < 20 ns.

Capacitance ($T_a = 25^{\circ}C$, $f = 1$ MHz)

Parameter	Symbol	Min	Type	Max	Unit	Test conditions
Input capacitance	C_{in}	—	—	8	pF	$V_{in} = 0$ V
Output capacitance	C_{out}	—	—	12	pF	$V_{out} = 0$ V

Input voltage	V_{IL}	-0.5	—	0.8	V	
	V_{IH}	2.0	—	$V_{CC} + 0.5 \text{ V}$		
Output voltage	V_{OL}	—	—	0.45	V	$I_{OL} = 5.8 \text{ mA}$
	V_{OH1}	$0.85 \times V_{CC}$	—	—	V	$I_{OH} = -2.5 \text{ mA}$
	V_{OH2}	$V_{CC} - 0.4$	—	—	V	$I_{OH} = -100 \mu\text{A}$
Low V_{CC} lock-out voltage*2	V_{LKO}	1.2	—	—	V	

Notes: 1. All currents are RMS unless otherwise noted. Typical values at $V_{CC} = 3.3 \text{ V}$, $T_a = 25^\circ\text{C}$.

2. To protect initiation of write cycle during V_{CC} powerup/powerdown, a write cycle is locked out for V_{CC} less than V_{LKO} . If V_{CC} is less than V_{LKO} Write State Machine is reset to read mode. When the Write State Machine is in Busy state, if V_{CC} is less than V_{LKO} , the alternation of memory contents may occur.

HN29WT800 Series, HN29WB800 Series

AC Characteristics ($V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, $T_a = 0 \text{ to } +70^\circ\text{C}$)

Test Conditions

- Input pulse levels: $V_{IL} = 0 \text{ V}$, $V_{IH} = 3.0 \text{ V}$
- Input rise and fall time: $\leq 10 \text{ ns}$ (HN29WT/WB800-10/12 Series)
- : $\leq 5 \text{ ns}$ (HN29WT/WB800-8 Series)
- Output load: 1 TTL gate +100 pF (Including scope and jig.) (HN29WT/WB800-10/12 Series)
- : 1 TTL gate +30 pF (Including scope and jig.) (HN29WT/WB800-8 Series)
- Reference levels for measuring timing: 1.5 V

V_{CC} Powerup/Powerdown Timing

Parameter	Symbol	Min	Type	Max	Unit
$\overline{RP} = V_{IH}$ setup time from V_{CC} min	t_{VCS}	2	—	—	μs

Note: During powerup/powerdown, by the noise pulses on control pins, the device has possibility of accidental erasure or programming. The device must be protected against initiation of write cycle for memory contents during powerup/powerdown. The delay time of min 2 μs is always required before read operation or write operation is initiated from the time V_{CC} reaches V_{CC} min during powerup/powerdown. By holding $\overline{RP}$ V_{IL} , the contents of memory is protected during V_{CC} powerup/powerdown. During powerup, $\overline{RP}$ must be held V_{IL} for min 2 μs from the time V_{CC} reaches V_{CC} min. During powerdown, $\overline{RP}$ must be held V_{IL} until V_{CC} reaches V_{SS} . $\overline{RP}$ doesn't have latch mode, so $\overline{RP}$ must be held V_{IH} during read operation or erase/program operation.

Lock Bit Program Flowchart

Data Protection Operation

Page programming and Block Erasing can be locked by programming a nonvolatile lock bit for each block. When $\overline{WP}$ is V_{IL} level, those locked blocks as reflected by the Block-Lock Status bits, are protected from inadvertent Page programming or Block Erasing.

Programmed block data and Lock-Bit Data can be locked When $\overline{WP}$ is V_{IL} level.

HN29WT800 Series, HN29WB800 Series

Programmed block data and Lock-Bit Data can be erased by block erase command When $\overline{WP}$ is V_{IH} level or $\overline{RP}$ is V_{HH} level.
