128K X 8 CMOS STATIC RAM MODULE

IDT8M824S

FEATURES:

- High-density 1 megabit (128K x 8) CMOS static RAM module
- High-speed
 - Military: 35ns (max.)
 - Commercial: 25ns (max.)
- Low power consumption
 - Active: less than 550mW (typ.)
 - Standby: less than 20mW (typ.)
- Offered in the JEDEC standard 32-pin, 600 mil wide ceramic sidebraze DIP
- Single 5V ($\pm 10\%$) power supply
- Inputs and outputs directly TTL-compatible

DESCRIPTION:

The IDT8M824S is a 128K x 8 high-speed CMOS static RAM constructed on a co-fired ceramic substrate using four 32K x 8 static RAMs and a FCT139 decoder in leadless chip carriers. Functional equivalence to monolithic one megabit static RAMs is achieved by utilization of an on board decoder that interprets the higher order address A15 and A16 to select one of the four 32K x 8 RAMs. Extremely fast speeds can be achieved with this technique due to use of 256K static RAMs and the decoder fabricated in IDT's high-performance, high-reliability CEMOS technology.

The IDT8M824S is available with maximum access times as fast as 25ns for commercial temperature range, with maximum power consumption of 2.5 watts. The module offers a full standby mode of 440mW (max.).

The IDT8M824S is offered in a 32-pin, 600 mil center sidebraze DIP, adhering to JEDEC standards for one megabit monolithic pinouts.

All inputs and outputs of the IDT8M824S are TTL-compatible and operate from a single 5V supply. Fully asynchronous circuitry is used, requiring no clocks or refreshing for operation.

All IDT military module semiconductor components are manufactured in compliance to the latest revision of MIL-STD-883, Class B, making them ideally suited to applications demanding the highest level of performance and reliability.

NOTE:

1. This parameter guaranteed by design but not tested.

TIMING WAVEFORM OF READ CYCLE NO. 1⁽¹⁾

TIMING WAVEFORM OF READ CYCLE NO. 2^(1,2,4)

TIMING WAVEFORM OF READ CYCLE NO. 3^(1,3,4)

NOTES:

1. WE is High for Read Cycle.
2. Device is continuously selected, $\overline{CS} = V_{IL}$.
3. Address valid prior to or coincident with $\overline{CS}$ transition low.
4. $\overline{OE} = V_{IL}$.
5. Transition is measured $\pm 200mV$ from steady state. This parameter guaranteed by design, but not tested.

TIMING WAVEFORM OF WRITE CYCLE NO. 1 ($\overline{WE}$ CONTROLLED TIMING) ^(1,2,3,7)

TIMING WAVEFORM OF WRITE CYCLE NO. 2 ($\overline{CS}$ CONTROLLED TIMING) ^(1,2,3,5)

NOTES:

1. $\overline{WE}$ or $\overline{CS}$ must be high during all address transitions.
2. A write occurs during the overlap (t_{WP}) of a low $\overline{CS}$ and a low $\overline{WE}$.
3. t_{WR} is measured from the earlier of $\overline{CS}$ or $\overline{WE}$ going high to the end of the write cycle.
4. During this period, the I/O pins are in the output state, and input signals must not be applied.
5. If the $\overline{CS}$ low transition occurs simultaneously with or after the $\overline{WE}$ low transition, the outputs remain in the high impedance state.
6. Transition is measured $\pm 200\text{mV}$ from steady state with a 5pF load (including scope and jig). This parameter guaranteed by design, but not tested.
7. During a $\overline{WE}$ controlled write cycle, write pulse ($t_{WP} > t_{WHZ} + t_{OW}$) to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{OW} . If $\overline{OE}$ is high during a $\overline{WE}$ controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP} .
