## 1 FEATURES

- Single-chip LCD controller/driver
- 65 row, 133 column outputs
- Display data RAM $65 \times 133$ bits
- 133 icons (last row is used for icons)
- Fast mode $\mathrm{I}^{2} \mathrm{C}$-bus interface (400 kbits/s)
- Software selectable multiplex rates:
$1: 17,1: 26,1: 34,1: 49$ and $1: 65$
- On-chip:
- Generation of intermediate LCD bias voltages
- Oscillator requires no external components (external clock also possible)
- Generation of $\mathrm{V}_{\mathrm{LCD}}$.
- CMOS compatible inputs
- Software selectable bias configuration
- Logic supply voltage range $\mathrm{V}_{\mathrm{DD} 1}$ to $\mathrm{V}_{\mathrm{SS} 1} 4.5$ to 5.5 V
- Supply voltage range for high voltage part $\mathrm{V}_{\mathrm{DD} 2}$ and $\mathrm{V}_{\mathrm{DD} 3}$ to $\mathrm{V}_{\mathrm{SS} 2}$ and $\mathrm{V}_{\mathrm{SS} 3} 4.5$ to 5.5 V
- Display supply voltage range $\mathrm{V}_{\mathrm{LCD}}$ to $\mathrm{V}_{\mathrm{SS}}$ :
- Mux rate 1:65: 8 to 16 V .
- Low power consumption, suitable for battery operated systems
- Internal Power-on reset and/or external reset
- Temperature read back available
- Manufactured in N -well silicon gate CMOS process.

## 5 BLOCK DIAGRAM

Fig. 1 Block diagram.

### 5.1 Block diagram functions

### 5.1.1 OSCILLATOR

The on-chip oscillator provides the display clock for the system; it requires no external components. Alternatively, an external display clock may be provided via the OSC input. The OSC input must be connected to $\mathrm{V}_{\mathrm{DD} 1}$ or $\mathrm{V}_{\mathrm{SS} 1}$ when not in use. During power-down additional current saving can be made if the external clock is disabled.

### 5.1.2 POWER-ON RESET

The on-chip Power-on reset initializes the chip after power-on or power failure.

### 5.1.3 $\quad \mathrm{I}^{2} \mathrm{C}$-BUS CONTROLLER

The $\mathrm{I}^{2} \mathrm{C}$-bus controller detects the $\mathrm{I}^{2} \mathrm{C}$-bus protocol, slave address, commands and display data bytes. It performs the conversion of the data input (serial-to-parallel). The PCF8535 acts as an $\mathrm{I}^{2} \mathrm{C}$-bus slave and therefore cannot initiate bus communication.

### 5.1.4 INPUT FILTERS

Input filters are provided to enhance noise immunity in electrically adverse environments; RC low-pass filters are provided on the SDA, SCL and $\overline{\operatorname{RES}}$ lines.

### 5.1.5 DISPLAY DATA RAM

The PCF8535 contains a $65 \times 133$ bit static RAM which stores the display data. The RAM is divided into 9 banks of 133 bytes. The last bank is used for icon data and is only one bit deep. During RAM access, data is transferred to the RAM via the $I^{2} \mathrm{C}$-bus interface. There is a direct correspondence between the X address and the column output number.

### 5.1.6 Timing generator

The timing generator produces the various signals required to drive the internal circuitry. Internal chip operation is not disturbed by operations on the data bus.

### 5.1.7 AdDRESS COUNTER

The Address Counter (AC) sends addresses to the Display Data RAM (DDRAM) for writing.

### 5.1.8 DISPLAY ADDRESS COUNTER

The display is generated by continuously shifting rows of RAM data to the dot matrix LCD via the column outputs. The display status (all dots on or off, normal or inverse video) is set via the $\mathrm{I}^{2} \mathrm{C}$-bus.

## 6 PINNING

| SYMBOL | PAD | DESCRIPTION |
| :---: | :---: | :---: |
|  | 1 | dummy pad |
|  | 2 | bump/alignment mark 1 |
| R0 to R15 | 3 to 18 | LCD row driver outputs |
| C0 to C132 | 19 to 151 | LCD column driver outputs |
| R47 to R33 | 152 to 166 | LCD row driver outputs |
|  | 167 | bump/alignment mark 2 |
|  | 168 | dummy pad |
| R48 to R64 | 169 to 185 | LCD row driver outputs; R64 is icon row |
|  | 186 | bump/alignment mark 3 |
|  | 187 to 189 | dummy pad |
| OSC | 190 | oscillator |
| $\mathrm{V}_{\text {LCDIN }}$ | 191 to 196 | LCD supply voltage |
| V LCDOUT | 197 to 203 | voltage multiplier output |
| VLCDSENSE | 204 | voltage multiplier regulation input (VLCD) |
|  | 205 and 206 | dummy pad |
| $\overline{\mathrm{RES}}$ | 207 | external reset input (active LOW) |
| T3 | 208 | test output 3 |
| T2 | 209 | test output 2 |
| T1 | 210 | test output 1 |
| $\mathrm{V}_{\mathrm{DD} 2}$ | 211 to 218 | supply voltage 2 |
| $\mathrm{V}_{\text {DD3 }}$ | 219 to 222 | supply voltage 3 |
| $\mathrm{V}_{\mathrm{DD} 1}$ | 223 to 228 | supply voltage 1 |
|  | 229 | dummy pad |
| SDA | 230 and 231 | $\mathrm{I}^{2} \mathrm{C}$-bus serial data inputs |
| SDAOUT | 232 | $\mathrm{I}^{2} \mathrm{C}$-bus serial data output |
| SA1 | 233 | ${ }^{2} \mathrm{C}$-bus slave address input |
| SA0 | 234 | $\mathrm{I}^{2} \mathrm{C}$-bus slave address input |
| $\mathrm{V}_{\text {SS2 }}$ | 235 to 242 | ground 2 |
| $\mathrm{V}_{\text {SS } 1}$ | 243 to 250 | ground 1 |
| T5 | 251 | test input 5 |
| T4 | 252 | test input 4 |
|  | 253 | dummy pad |
| SCL | 254 and 255 | $\mathrm{I}^{2} \mathrm{C}$-bus serial clock inputs |
|  | 256 | bump/alignment mark 4 |
| R32 to R16 | 257 to 273 | LCD row driver outputs |

### 6.1 Pin functions

### 6.1.1 R0 to R64

These pads output the display row signals.

### 6.1.2 C0 то C132

These pads output the display column signals.

### 6.1.3 $V_{S S 1}$ AND $V_{S S 2}$

$\mathrm{V}_{\mathrm{SS} 1}$ and $\mathrm{V}_{\mathrm{SS} 2}$ must be connected together.

### 6.1.4 $V_{D D 1}$ TO $V_{D D 3}$

$\mathrm{V}_{\mathrm{DD} 1}$ is the logic supply. $\mathrm{V}_{\mathrm{DD} 2}$ and $\mathrm{V}_{\mathrm{DD} 3}$ are for the voltage multiplier. For split power supplies $\mathrm{V}_{\mathrm{DD} 2}$ and $\mathrm{V}_{\mathrm{DD} 3}$ must be connected together. If only one supply voltage is available, all three supplies must be connected together.

### 6.1.5 $V_{\text {LCDOUT }}$

If, in the application, an external $\mathrm{V}_{\mathrm{LCD}}$ is used, $\mathrm{V}_{\text {LCDOUT }}$ must be left open-circuit; otherwise (if the internal voltage multiplier is enabled) the chip may be damaged. V LCDOUT should not be driven when $V_{D D 1}$ is below its minimum allowed value otherwise a low impedance path between $\mathrm{V}_{\text {LCDOUT }}$ and $\mathrm{V}_{\text {SS1 }}$ will exist.

### 6.1.6 $\quad V_{\text {LCDIN }}$

This is the $V_{L C D}$ supply for when an external $V_{L C D}$ is used. If the internal $V_{\text {LCD }}$ generator is used, then $\mathrm{V}_{\text {LCDOUT }}$ and $V_{\text {LCDIN }}$ must be connected together. $\mathrm{V}_{\text {LCDIN }}$ should not be driven when $V_{D D 1}$ is below its minimum allowed value, otherwise a low impedance path between $\mathrm{V}_{\text {LCDIN }}$ and $\mathrm{V}_{\mathrm{SS} 1}$ will exist.

### 6.1.7 VLCDSENSE

This is the input to the internal voltage multiplier regulator. It must be connected to $\mathrm{V}_{\text {LCDOUT }}$ when the internal voltage generator is used otherwise it may be left open-circuit.
$\mathrm{V}_{\text {LCDSENCE }}$ should not be driven when $\mathrm{V}_{\mathrm{DD} 1}$ is below its minimum allowed value, otherwise a low impedance path between $\mathrm{V}_{\text {LCDSENCE }}$ and $\mathrm{V}_{\mathrm{SS} 1}$ will exist.

### 6.1.8 SDA

$\mathrm{I}^{2} \mathrm{C}$-bus serial data input.

### 6.1.9 SDAOUT

SDAOUT is the serial data acknowledge for the $\mathrm{I}^{2} \mathrm{C}$-bus. By connecting SDAOUT to SDA externally, the SDA line becomes fully $\mathrm{I}^{2} \mathrm{C}$-bus compatible. Having the acknowledge output separated from the serial data line is advantageous in Chip-On-Glass (COG) applications. In COG applications where the track resistance from the SDAOUT pad to the system SDA line can be significant, a potential divider is generated by the bus pull-up resistor
and the Indium Tin Oxide (ITO) track resistance. It is possible that during the acknowledge cycle the PCF8535 will not be able to create a valid logic 0 level. By splitting the SDA input from the SDAOUT output the device could be used in a mode that ignores the acknowledge bit. In COG applications where the acknowledge cycle is required or where read back is required, it is necessary to minimize the track resistance from the SDAOUT pad to the system SDA line to guarantee a valid LOW level.
6.1.10 SCL
$\mathrm{I}^{2} \mathrm{C}$-bus serial clock input.

### 6.1.11 SA0 AND SA1

Least significant bits of the $\mathrm{I}^{2} \mathrm{C}$-bus slave address.
Table 1 Slave address; see note 1

| SA1 AND SA0 | MODE | SLAVE ADDRESS |
| :---: | :---: | :---: |
| 0 and 0 | write | 78 H |
|  | read | 79 H |
| 0 and 1 | write | 7 AH |
|  | read | 7 BH |
| 1 and 0 | write | 7 CH |
|  | read | 7 DH |
| 1 and 1 | write | 7 EH |
|  | read | 7 FH |

## Note

1. The slave address is a concatination of the following bits $\{01111$, SA1, SA0 and R/W $\}$.

### 6.1.12 OSC

If the on-chip oscillator is used this input must be connected to $\mathrm{V}_{\mathrm{DD} 1}$ or $\mathrm{V}_{\mathrm{SS} 1}$.

### 6.1.13 RES

External reset pad: when this pad is LOW the chip will be reset; see Section 7.1. If an external reset is not required, this pad must be tied to $\mathrm{V}_{\mathrm{DD1}}$. Timing for the RES pad is given in Chapter 12.

### 6.1.14 T1, T2, T3, T4 AND T5

In applications T 4 and T 5 must be connected to $\mathrm{V}_{\text {SS }}$. T1, T2 and T3 are to be left open-circuit.

## 7 FUNCTIONAL DESCRIPTION

The PCF8535 is a low power LCD driver designed to interface with microprocessors/microcontrollers and a wide variety of LCDs.

The host microprocessor/microcontroller and the PCF8535 are both connected to the $\mathrm{I}^{2} \mathrm{C}$-bus. The SDA and SCL lines must be connected to the positive power supply via pull-up resistors. The internal oscillator requires no external components. The appropriate intermediate biasing voltage for the multiplexed LCD waveforms are generated on-chip. The only other connections required to complete the system are to the power supplies ( $\mathrm{V}_{\mathrm{DD}}, \mathrm{V}_{\mathrm{SS}}$ and $\mathrm{V}_{\mathrm{LCD}}$ ) and suitable capacitors for decoupling $\mathrm{V}_{\mathrm{LCD}}$ and $\mathrm{V}_{\mathrm{DD}}$.

Fig. 2 Typical system configuration.

### 7.1 Reset

The PCF8535 has two reset modes; internal Power-on reset or external reset. Reset initiated from either the RES pad or the internal Power-on reset block will initialize the chip to the following starting condition:

- Power-down mode (PD = 1)
- Horizontal addressing $(\mathrm{V}=0)$; no mirror X or Y ( $\mathrm{MX}=0$ and $\mathrm{MY}=0$ )
- Display blank ( $\mathrm{D}=0$ and $\mathrm{E}=0$ )
- Address counter $\mathrm{X}[6: 0]=0, \mathrm{Y}[2: 0]=0$ and $\mathrm{XM}_{0}=0$
- Bias system $\mathrm{BS}[2: 0]=0$
- Multiplex rate M[2:0] = 0 (Mux rate 1:17)
- Temperature control mode TC[2:0] = 0
- HV-gen control, HVE $=0$ the HV generator is switched off, PRS $=0$ and S[1:0] $=00$
- $V_{\text {LCDOUT }}$ is equal to 0 V
- RAM data is unchanged (Note: RAM data is undefined after power-up)
- All row and column outputs are set to $\mathrm{V}_{\text {SS }}$ (display off)
- TRS and BRS are set to zero
- Direct mode is disabled ( $\mathrm{DM}=0$ )
- Internal oscillator is selected, but not running ( $\mathrm{EC}=0$ )
- Bias current set to low current mode ( $\mathrm{IB}=0$ ).

### 7.2 Power-down

During power-down all static currents are switched off (no internal oscillator, no timing and no LCD segment drive system) and all LCD outputs are internally connected to $V_{S s}$. The serial bus function remains active.

### 7.3 LCD voltage selector

The practical value for $\mathrm{V}_{\mathrm{OP}}$ is determined by equating $\mathrm{V}_{\text {off(rms) }}$ with defined LCD threshold voltage ( $\mathrm{V}_{\text {th }}$ ), typically when the LCD exhibits approximately $10 \%$ contrast.

### 7.4 Oscillator

The internal logic operation and the multi-level drive signals of the PCF8535 are clocked by the built-in RC oscillator. No external components are required.

### 7.5 Timing

The timing of the PCF8535 organizes the internal data flow of the device. The timing also generates the LCD frame frequency which is derived from the clock frequency generated in the internal clock generator.

### 7.6 Column driver outputs

The LCD drive section includes 133 column outputs ( C 0 to C 132 ) which should be connected directly to the LCD. The column output signals are generated in accordance with the multiplexed row signals and with the data in the display latch. When less than 133 columns are required the unused column outputs should be left open-circuit.

### 7.7 Row driver outputs

The LCD drive section includes 65 row outputs (R0 to R64) which should be connected directly to the LCD. The row output signals are generated in accordance with the selected LCD drive mode. If lower Mux rates or less than 65 rows are required, the unused outputs should be left open-circuit.

### 7.8 Drive waveforms

[^0]Fig. 3 Typical LCD driver waveforms.

## $65 \times 133$ pixel matrix driver

### 7.9 Set multiplex rate

The PCF8535 can be used to drive displays of varying sizes. The multiplex mode selected controls which rows are used. In all cases, the last row is always driven and is intended for icons. If Top Row Swap (TRS) is at logic 1 then the icon row will be output on pad R48. M[2:0] selects the multiplex rate (see Table 2).

Table 2 Multiplex rates

| M[2] | M[1] | M[0] | MULTIPLEX RATE | ACTIVE ROWS |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | $1: 17$ | R0 to R15 and R64 |
| 0 | 0 | 1 | $1: 26$ | R0 to R24 and R64 |
| 0 | 1 | 0 | $1: 34$ | R0 to R32 and R64 |
| 0 | 1 | 1 | $1: 49$ | R0 to R47 and R64 |
| 1 | 0 | 0 | $1: 65$ | R0 to R64 |
| $101-111$ |  |  |  |  |

### 7.10 Bias system

### 7.10.1 SET BIAS SYSTEM

The bias voltage levels are set in the ratio of $R-R-n R-R-R$. Different multiplex rates require different factors $n$. This is programmed by $B S[2: 0]$. For optimum bias values, $n$ can be calculated from: $n=\sqrt{M u x}$ rate -3

Changing the bias system from the optimum will have a consequence on the contrast and viewing angle. One reason to come away from the optimum would be to reduce the required $\mathrm{V}_{\mathrm{OP}}$. A compromise between contrast and $\mathrm{V}_{\mathrm{Op}}$ must be found for any particular application.

Table 3 Programming the required bias system

| BS[2] | BS[1] | BS[0] | $\mathbf{n}$ | BIAS MODE | TYPICAL MUX RATES |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 7 | $1 / 11$ | $1: 100$ |
| 0 | 0 | 1 | 6 | $1 / 10$ | $1: 80$ |
| 0 | 1 | 0 | 5 | $1 / 9$ | $1: 65$ |
| 0 | 1 | 1 | 4 | $1 / 8$ | $1: 49$ |
| 1 | 0 | 0 | 3 | $1 / 7$ | $1: 33$ |
| 1 | 0 | 1 | 2 | $1 / 6$ | $1: 26$ |
| 1 | 1 | 0 | 1 | $1 / 5$ | $1: 17$ |
| 1 | 1 | 1 | 0 | $1 / 4$ | $1: 9$ |

Table 4 Example of LCD bias voltage for $1 / 7$ bias, $\mathrm{n}=3$

| SYMBOL | BIAS VOLTAGE FOR ${ }^{\mathbf{1} / 7}$ BIAS |
| :---: | :---: |
| V 1 | $\mathrm{~V}_{\mathrm{LCD}}$ |
| V 2 | $6 / 7 \times \mathrm{V}_{\mathrm{LCD}}$ |
| V 3 | $5 / 7 \times \mathrm{V}_{\mathrm{LCD}}$ |
| V 4 | $2 / 7 \times \mathrm{V}_{\mathrm{LCD}}$ |
| V 5 | $1 / 7 \times \mathrm{V}_{\mathrm{LCD}}$ |
| V 6 | $\mathrm{~V}_{\mathrm{SS}}$ |

### 7.11 Temperature measurement

### 7.11.1 TEMPERATURE READ BACK

The PCF8535 has an in-built temperature sensor. For power saving, the sensor should only be enabled when a measurement is required. It will not operate in power-down mode. The temperature read back requires a clock to operate. Normally the internal clock is used but, if the device is operating from an external clock, then this must be present for the measurement to work. $V_{\text {DD2 }}$ and $\mathrm{V}_{\mathrm{DD} 3}$ must also be applied. A measurement is initialized by setting the SM bit. Once started the SM bit will be automatically cleared. An internal oscillator will be initialized and allowed to warm-up for approximately 2 frame periods. After this the measurement starts and lasts for a maximum of 2 frame periods.

Temperature data is returned via a status register. During the measurement the register will contain zero. Once the measurement is completed the register will be updated with the current temperature (non zero value). Because the $\mathrm{I}^{2} \mathrm{C}$-bus interface is asynchronous to the temperature measurement, read back prior to the end of the measurement is not guaranteed. If this mode is required the register should be read twice to validate the data.

The ideal temperature read-out can be calculated as follows;

$$
\begin{equation*}
\mathrm{TR}_{\text {ideal }}=128+\left(\mathrm{T}-27^{\circ} \mathrm{C}\right) \times \frac{1}{\mathrm{C}} \tag{1}
\end{equation*}
$$

where T is the on-chip temperature in ${ }^{\circ} \mathrm{C}$ and c is the conversion constant; $\mathrm{c}=1.17^{\circ} \mathrm{C} / \mathrm{sb}$.

To improve the accuracy of the temperature measurement a calibration is recommended during the assembly of the final product.

For calibrating the temperature read-out a measurement must be taken at a defined temperature. The offset between the ideal read-out and the actual result has to be stored into a non-volatile register (e.g. EEPROM);
Offset $=T R_{\text {ideal }}-$ TR $_{\text {meas }}$
where $\mathrm{TR}_{\text {meas }}$ is the actual temperature read-out of the PCF8535.

The calibrated temperature read-out can be calculated for each measurement as follows:
$T R_{\text {cal }}=T R_{\text {meas }}+$ Offset
The accuracy after the calibration is $\pm 6.7 \%$ (plus $\pm 1 \mathrm{lsb}$ ) of the difference between the current temperature and the calibration temperature. For this reason a calibration at or near the most sensitive temperature for the display is recommended.
E.g. for a calibration at $25^{\circ} \mathrm{C}$ with the current temperature at $-20^{\circ} \mathrm{C}$, the absolute error may be calculated as:
Absolute error $=0.067 \times\left(25^{\circ} \mathrm{C}--20^{\circ} \mathrm{C}\right)$
$= \pm 3^{\circ} \mathrm{C}+ \pm 1 \mathrm{Isb}= \pm 4.17^{\circ} \mathrm{C}$.

### 7.12 Temperature compensation

### 7.12.1 TEMPERATURE COEFFICIENTS

Due to the temperature dependency of the liquid crystals viscosity the LCD controlling voltage, V must be increased at lower temperatures to maintain optimum contrast.
Figure 4 shows $V_{\text {LCD }}$ as a function of temperature for a typical high multiplex rate liquid.

In the PCF8535 the temperature coefficient of $\mathrm{V}_{\text {LCD }}$ can be selected from 8 values by setting bits TC[2:0],
see Table 5.

Fig. $4 \mathrm{~V}_{\mathrm{LCD}}$ as function of liquid crystal temperature (typical values).

Table 5 Selectable temperature coefficients

| TC[2] | TC[1] | TC[0] | TC VALUE | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | $1 /{ }^{\circ} \mathrm{C}$ |
| 0 | 0 | 1 | $-0.44 \times 10^{-3}$ | $1 /{ }^{\circ} \mathrm{C}$ |
| 0 | 1 | 0 | $-1.10 \times 10^{-3}$ | $1 /{ }^{\circ} \mathrm{C}$ |
| 0 | 1 | 1 | $-1.45 \times 10^{-3}$ | $1 /{ }^{\circ} \mathrm{C}$ |
| 1 | 0 | 0 | $-1.91 \times 10^{-3}$ | $1 /{ }^{\circ} \mathrm{C}$ |
| 1 | 0 | 1 | $-2.15 \times 10^{-3}$ | $1 /{ }^{\circ} \mathrm{C}$ |
| 1 | 1 | 0 | $-2.32 \times 10^{-3}$ | $1 /{ }^{\circ} \mathrm{C}$ |
| 1 | 1 | 1 | $-2.74 \times 10^{-3}$ | $1 /{ }^{\circ} \mathrm{C}$ |

### 7.13 $\mathrm{V}_{\mathrm{OP}}$

### 7.13.1 Set Vop value

The voltage at the reference temperature can be calculated as: $\left[\mathrm{V}_{\mathrm{LCD}}\left(\mathrm{T}=\mathrm{T}_{\text {cut }}\right)\right]$
$\mathrm{V}_{\mathrm{LCD}_{\text {(Tout) }}}=\left(\mathrm{a}+\mathrm{V}_{\mathrm{OP}} \times \mathrm{b}\right)$
The operating voltage, $\mathrm{V}_{\mathrm{OP}}$, can be set by software. The generated voltage is dependent on the temperature, programmed Temperature Coefficient (TC) and the programmed voltage at the reference temperature ( $\mathrm{T}_{\text {cut }}$ ):

$$
\begin{equation*}
\mathrm{V}_{\mathrm{LCD}}=\left(\mathrm{a}+\mathrm{V}_{\mathrm{OP}} \times \mathrm{b}\right) \times\left(1+\left(\left(\mathrm{T}-\mathrm{T}_{\mathrm{cut}}\right) \times \mathrm{TC}\right)\right) \tag{5}
\end{equation*}
$$

The values for $T_{\text {cut }}$, $a$ and $b$ are given in Table 6. The maximum voltage that can be generated is dependent on the voltage $\mathrm{V}_{\mathrm{DD} 2}$ and the display load current. Two overlapping $\mathrm{V}_{\mathrm{OP}}$ ranges are selectable via the command page "Hv-gen control", see Fig.5.

The low range offers programming from 4.5 to 10.215 V , with the high range from 10.215 to 15.93 V at the cut point temperature, $\mathrm{T}_{\text {cut }}$. Care must be taken, when using temperature coefficients, that the programmed voltage does not exceed the maximum allowed $\mathrm{V}_{\mathrm{LCD}}$ voltage, see Chapter 10.

For a particular liquid, the optimum $\mathrm{V}_{\mathrm{LCD}}$ can be calculated for a given multiplex rate. For a Mux rate of $1: 65$, the optimum operating voltage of the liquid can be calculated as:
$V_{\text {LCD }}=\frac{1+\sqrt{65}}{\sqrt{2 \times\left(1-\frac{1}{\sqrt{65}}\right)}} \times V_{t h}=6.85 \times V_{\text {th }}$
where $\mathrm{V}_{\text {th }}$ is the threshold voltage of the liquid crystal material used.

Table 6 Values for parameters of the HV generator programming

| SYMBOL | BITS | VALUE | UNIT |
| :--- | :---: | :---: | :---: |

|  |  | 0.045 | V |
|  |  | 27 | ${ }^{\circ} \mathrm{C}$ |

$\mathrm{V}_{\mathrm{OP}}[6: 0]$ programming $(00 \mathrm{H}$ to 7 FH , programming range LOW and HIGH).
Fig. $5 \mathrm{~V}_{\mathrm{OP}}$ programming of PCF8535.

### 7.14 Voltage multiplier control

### 7.14.1 S[1:0]

The PCF8535 incorporates a software configurable voltage multiplier. After reset ( $\overline{\mathrm{RES}}$ ) the voltage multiplier is set to $2 \times \mathrm{V}_{\mathrm{DD} 2}$. Other voltage multiplier factors are set via the HV-gen command page. Before switching on the charge pump, the charge pump has to be pre-charged using the following sequence.

A starting state of $\mathrm{HVE}=0, \mathrm{DOF}=0, \mathrm{PD}=1$ and $\mathrm{DM}=0$ is assumed. A small delay between steps is indicated. The recommended wait period is $20 \mu$ s per 100 nF of capacitance on $\mathrm{V}_{\mathrm{LCD}}$.

1. Set $\mathrm{DM}=1$ and $\mathrm{PD}=0$
2. Delay
3. Set the multiplication factor to 2 by setting $\mathrm{S}[1: 0]=00$
4. Set the required $V_{O p}$ and PRS.
5. Set HVE $=1$ to switch-on the charge pump with a multiplication factor of 2
6. Delay
7. Increase the number of stages, one at a time, with a delay between each until the required level is achieved.

Table 7 HV generator multiplication factor

| $\mathbf{S}[1]$ | $\mathbf{S}[\mathbf{0}]$ | MULTIPLICATION FACTOR |
| :---: | :---: | :---: |
| 0 | 0 | $2 \times \mathrm{V}_{\mathrm{DD} 2}$ |
| 0 | 1 | $3 \times \mathrm{V}_{\mathrm{DD} 2}$ |
| 1 | 0 | $4 \times \mathrm{V}_{\mathrm{DD} 2}$ |
| 1 | 1 | $5 \times \mathrm{V}_{\mathrm{DD} 2}$ |

### 7.15 Addressing

Addressing of the RAM can be split into two parts; input addressing and output addressing. Input addressing is concerned with writing data into the RAM. Output addressing is almost entirely automatic and taken care of by the device, however, it is possible to affect the output mode.

### 7.15.1 INPUT ADDRESSING

Data is down loaded byte wise into the RAM matrix of the PCF8535 as indicated in Figs 6 to 10.

The display RAM has a matrix of $65 \times 133$ bits.
The columns are addressed by a combination of the $X$ address pointer and the $X$-RAM page pointer, whilst the rows addressed in groups of 8 by the Y address pointer. The $X$ address pointer has a range of 0 to 127 (7FH). Its range can be extended by the X-RAM page pointer, $\mathrm{XM}_{0}$. The Y address pointer has a range of 0 to $8(08 \mathrm{H})$. The PCF8535 is limited to 133 columns by 65 rows, addressing the RAM outside of this area is not allowed.

Table 8 Effect of X-RAM page pointer

| $\mathbf{X}$ ADDRESS POINTER | $\mathbf{X}$-RAM PAGE POINTER <br> $\mathbf{X M}_{\mathbf{0}}$ | ADDRESSED COLUMN <br> $\mathbf{M X}=\mathbf{0}$ | ADDRESSED COLUMN <br> $\mathbf{M X}=\mathbf{1}$ |
| :---: | :---: | :---: | :---: |
| 0 | 0 | C 0 | C 132 |

| 0 | 1 | C 128 | C 4 |
| 1 | 1 | C 129 | C 3 |
| $:$ | $:$ | C 132 | $:$ |
| 4 | 1 |  | C 0 |

Fig. 6 RAM format, input addressing.

Fig. 7 DDRAM to display mapping.

Two automated addressing modes are available; vertical addressing ( $\mathrm{V}=1$ ) and horizontal addressing ( $\mathrm{V}=0$ ). These modes change the way in which the auto-incrementing of the address pointers is handled and are independent of multiplex rate. The auto-incrementing works in a way so as to aid filling of the entire RAM. It is not a prerequisite of operation that the entire RAM is filled; in lower multiplex modes not all of the RAM will be needed. For these multiplex rates, use of horizontal addressing mode $(\mathrm{V}=0)$ is recommended.
Addressing the icon row is a special case as these RAM locations are not automatically accessed. These locations must be explicitly addressed by setting the Y address pointer to 8.
The Y address pointer does not auto-increment when the $X$ address over or underflows, it stays set to 8 . Writing icon data is independent of the vertical and horizontal addressing mode, but is effected by the mirror X bit as described in Sections 7.15.1.2 and 7.15.1.3.

The addressing modes may be further modified by the mirror $X$ bit $M X$. This bit causes the data to be written into the RAM from right to left instead of the normal left to right. This effectively flips the display about the Y axis. The MX bit affects the mode of writing into the RAM, changing the MX bit after RAM data is written will not flip the display.

### 7.15.1.1 Vertical addressing: non-mirrored;

$$
V=1 \text { and } M X=0
$$

In the vertical addressing mode data is written top to bottom and left to right. Here, the Y counter will auto-increment from 0 to 7 and then wrap around to 0 (see Fig.8). On each wrap over, the $X$ counter will increment to address the next column. When the $X$ counter wraps over from 127 to 0 , the $\mathrm{XM}_{0}$ bit will be set. The last address accessible is $Y=7, X=4$ and $X M_{0}=1$; after this access the counter will wrap around to $\mathrm{Y}=0, \mathrm{X}=0$ and $\mathrm{XM}_{0}=0$.

Fig. 8 Sequence of writing data bytes into the RAM with normal vertical addressing ( $V=1$ and $M X=0$ ).

### 7.15.1.2 Vertical addressing: mirrored; $V=1$ and $M X=1$

It is also possible to write data from right to left, instead of from the normal left to right, still going top to bottom. In the mirrored vertical addressing mode the $Y$ counter will auto-increment from 0 to 7 and then wrap around to 0 (see Fig.9). On each wrap-over, the $X$ counter will decrement to address the preceding column. The $\mathrm{XM}_{0}$ bit will be automatically toggled each time the X address counter wraps over from 0 . The last address accessible is $\mathrm{Y}=7, \mathrm{X}=0$ and $\mathrm{XM}_{0}=0$; after this access the counter will wrap around to $Y=0, X=4$ and $X M_{0}=1$.

Fig. 9 Sequence of writing data bytes into the RAM with mirrored vertical addressing ( $\mathrm{V}=1$ and $\mathrm{MX}=1$ ).

### 7.15.1.3 Horizontal addressing: non-mirrored; $V=0$ and $M X=0$

In horizontal addressing mode data is written from left to right and top to bottom. Here, the X counter will auto-increment from 0 to 127, set the $\mathrm{XM}_{0}$, then count 0 to 4 before wrapping around to 0 and clearing the $\mathrm{XM}_{0}$ bit (see Fig.10). On each wrap-over, the $Y$ counter will increment. The last address accessible is $Y=7, X=4$ and $X M_{0}=1$; after this access the counter will wrap around to $\mathrm{Y}=0, \mathrm{X}=0$ and $\mathrm{XM}_{0}=0$.

Fig. 10 Sequence of writing data bytes into the RAM with normal horizontal addressing ( $\mathrm{V}=0$ and $\mathrm{MX}=0$ ).

## $65 \times 133$ pixel matrix driver

PCF8535

### 7.15.1.4 Horizontal addressing: mirrored; $V=0$ and $M X=1$

It is also possible to write data from right to left, instead of from the normal left to right, still going top to bottom. In the mirrored horizontal addressing mode the $X$ counter will auto-decrement from 4 to 0 , clear the $X M_{0}$, then count 127 to 0 before wrapping around to 4 and setting the $\mathrm{XM}_{0}$ bit (see Fig.10). On each wrap-over, the Y counter will increment. The last address accessible is $\mathrm{Y}=7, \mathrm{X}=0$ and $\mathrm{XM}_{0}=0$; after this access the counter will wrap around to $\mathrm{Y}=0, \mathrm{X}=4$ and $\mathrm{XM}_{0}=1$.

MGS678

Fig. 11 Sequence of writing data bytes into the RAM with mirrored horizontal addressing ( $\mathrm{V}=0$ and $\mathrm{MX}=1$ ).

### 7.15.2 OUTPUT ADDRESSING

The output addressing of the RAM is done automatically in accordance with the currently selected multiplex rate. Normally the user would not need to make any alterations to the addressing. There are, however, circumstances pertaining to various connectivity of the device on a glass that would benefit from some in-built functionality. Three modes exist that enable the user to modify the output addressing, namely:

1. MY, mirror the $Y$ axis. This mode effectively flips the display about the $X$ axis, resulting in an upside down display. The effect is observable immediately the bit is modified. This is useful if the device is to be mounted above the display area instead of below.
2. Bottom Row Swap (BRS). This mode swaps the order of the rows on the bottom ${ }^{(1)}$ edge of the chip. This is useful to aide routing to the display when it is not possible to pass tracks under the device; a typical example would be in tape carrier package. This mode is often used in conjunction with TRS.
3. Top Row Swap (TRS). As with BRS, but swaps the order of rows on the top ${ }^{(1)}$ edge of the chip.

### 7.15.2.1 Mirror $Y$, MY

As described above, the Y axis is mirrored in the X axis.

Fig. 12 Mirror Y behaviour (Mux rate 1:65).

[^1]
## $65 \times 133$ pixel matrix driver

### 7.15.2.2 Bottom Row Swap

Here the order of the row pads is modified. Each block of rows is swapped about its local Y axis.

Fig. 13 Bottom row swap.

### 7.15.2.3 Top Row Swap

Here the order of the row pads is modified. Each block of rows is swapped about its local Y axis.

Fig. 14 Top row swap.

### 7.15.2.4 Output row order

The order in which the rows are activated is a function of bits MY, TRS, BRS and the selected multiplex mode.
Tables 9 to 12 give the order in which the rows are activated. In all cases, the RAM is accessed in a linear fashion, starting at zero with a jump to the last row for the icon data.

Table 9 Row order for BRS $=0$ and TRS $=0$

| MULTIPLEX MODE | MY = | MY = $\mathbf{1}$ |
| :---: | :--- | :--- |
| $1: 17$ | R0 to R15 and R64 | R15 to R0 and R64 |

### 7.16 Instruction set

Data accesses to the PCF8535 can be broken down into two areas, those that define the operating mode of the device and those that fill the display RAM; the distinction being the $\mathrm{D} / \overline{\mathrm{C}}$ bit. When the $\mathrm{D} / \overline{\mathrm{C}}$ bit is at logic 0 , the chip will respond to instructions as defined in Table 16. When the $D / \bar{C}$ bit is at logic 1 , the chip will store data into the RAM. Data may be written to the chip that is independent to the presence of the display clock.

There are 4 instruction types. Those which:

1. Define PCF8535 functions such as display configuration, etc.
2. Set internal RAM addresses
3. Perform data transfer with internal RAM
4. Others.

In normal use, category 3 instructions are the most frequently used. To lessen the MPU program load, automatic incrementing by one of the internal RAM address pointers after each data write is implemented.
The instruction set is broken down into several pages, each command page being individually addressed via the $\mathrm{H}[2: 0]$ bits.

### 7.16.1 RAM READ/WRITE COMMAND PAGE

This page is special in that it is accessible independently of the H bits. This page is mainly used as a stepping stone to other pages. Sending the 'Default $\mathrm{H}[2: 0]$ ' command will cause an immediate step to the 'Function and RAM command page' which will allow the $\mathrm{H}[2: 0]$ bits to be set.

### 7.16.2 Function and RAM Command page

### 7.16.2.1 Command page

Setting $\mathrm{H}[2: 0]$ will move the user immediately to the required command page. Pages not listed should not be accessed as the behaviour is not defined.
7.16.2.2 Function set

PD
When PD = 1, the LCD driver is in power-down mode:

- All LCD outputs at $\mathrm{V}_{\mathrm{SS}}$
- Oscillator off
- VLCDIN may be disconnected
- ${ }^{2} \mathrm{C}$-bus interface accesses are possible
- RAM contents are not cleared; RAM data can be written
- Register settings remain unchanged.

## V

When $\mathrm{V}=0$, horizontal addressing is selected. When $\mathrm{V}=1$, vertical addressing is selected. The behaviour is described in Section 7.15.

### 7.16.2.3 RAM page

The $\mathrm{XM}_{0}$ bit extends the RAM into a second page. The bit may be considered to be the Most Significant Bit (MSB) of an 8 -bit X address. The behaviour is described in Section 7.15.

### 7.16.2.4 Set $Y$ address

The Y address is used as a pointer to the RAM for RAM writing. The range is 0 to 8 . Each bank corresponds to a set of 8 rows, the only exception being bank 8 , which contains the icon data and is only 1-bit deep; see Table 13.

Table 13 Yaddress pointer

| $\mathbf{Y}[3]$ | $\mathbf{Y}[2]$ | $\mathbf{Y}[1]$ | $\mathbf{Y}[\mathbf{0}]$ | BANK | ROWS |
| :---: | :---: | :---: | :---: | :---: | :--- |
| 0 | 0 | 0 | 0 | bank 0 | R0 to R7 |
| 0 | 0 | 0 | 1 | bank 1 | R8 to R15 |
| 0 | 0 | 1 | 0 | bank 2 | R16 to R23 |
| 0 | 0 | 1 | 1 | bank 3 | R24 to R31 |
| 0 | 1 | 0 | 0 | bank 4 | R32 to R39 |
| 0 | 1 | 0 | 1 | bank 5 | R40 to R47 |
| 0 | 1 | 1 | 0 | bank 6 | R48 to R55 |
| 0 | 1 | 1 | 1 | bank 7 | R56 to R63 |
| 1 | 0 | 0 | 0 | bank 8 <br> (icons) | R64 |

### 7.16.2.5 Set $X$ address

The $X$ address is used as a pointer to the RAM for RAM writing. The range of $X$ is 0 to $127(7 \mathrm{FH})$ and may be extended by the $\mathrm{XM}_{0}$ bit. The combined value of $\mathrm{XM}_{0}$ and X address directly corresponds to the display column number when $M X=0$ and corresponds to the inverse display column number when $M X=1$; see Table 14.

Table 14 X address pointer

| $\mathbf{X M}_{\mathbf{0}}, \mathbf{X}[6: \mathbf{0}]$ | ADDRESSED <br> COLUMN, MX = $\mathbf{0}$ | ADDRESSED <br> COLUMN, MX = $\mathbf{1}$ |
| :---: | :---: | :---: |
| 0 | C 0 | C 132 |
| 1 | C 1 | C 131 |
| 2 | C 2 | C 130 |
| 3 | C 3 | C 129 |
| $:$ | $:$ | $:$ |
| 129 | C 129 | C 3 |
| 130 | C 130 | C 2 |
| 131 | C 131 | C 1 |
| 132 | C 132 | C 0 |

### 7.16.3 DISPLAY SETTING COMMAND PAGE

### 7.16.3.1 Display control

The D and E bits set the display mode as given in Table 15.

Table 15 Display control

| $\mathbf{D}$ | E | MODE |
| :---: | :---: | :---: |
| 0 | 0 | display blank |
| 1 | 0 | normal mode |
| 0 | 1 | all display segments on |
| 1 | 1 | inverse video |

### 7.16.3.2 External display control

Mirror X and mirror Y have the effect of flipping the display left to right or top to bottom respectively. MX works by changing the order data that is written into the RAM. As such, the effects of toggling MX will only be seen after data is written into the RAM. MY works by reversing the order that column data is accessed relative to the row outputs. The effect of toggling MY will be seen immediately. The behaviour of both of these bits is further described in Section 7.15.

### 7.16.3.3 Bias system

$\mathrm{BS}[2: 0]$ sets the bias system; see Section 7.10.

### 7.16.3.4 Display size

Physically large displays require stronger drivers. Bit IB enables the user to select a stronger driving mode and should be used if suitable display quality can not be achieved with the default setting.

### 7.16.3.5 Multiplex rate

M[2:0] sets the multiplex rate; see Section 7.9.

### 7.16.4 HV-GEN COMMAND PAGE

7.16.4.1 HV-gen control

PRS
Programmable charge pump range select. This bit defines whether the programmed voltage for $\mathrm{V}_{\mathrm{OP}}$ is in the low or the high range. The behaviour of this bit is further described in Section 7.13.

## HVE

High voltage generator enable. When set to logic 0 , the charge pump is disabled. When set to logic 1 , the charge pump is enabled.

### 7.16.4.2 HV-gen stages

$\mathrm{S}[1: 0]$ set the multiplication factor of the charge pump ranging from times 2 to times 5 . The behaviour of these bits is further described in Section 7.14.

### 7.16.4.3 Temperature coefficients

TC[2:0] set the required temperature coefficient. The behaviour of these bits is further described in Section 7.12.

### 7.16.4.4 Temperature measurement control

The SM bit is used to initiate a temperature measurement. The SM bit is automatically cleared at the end of the measurement. The behaviour of this bit is further described in Section 7.11.

### 7.16.4.5 $\quad V_{L C D}$ control

$\mathrm{V}_{\mathrm{OP}}[6: 0]$ sets the required operating voltage for the display.

### 7.16.5 SPECIAL FEATURE COMMAND PAGE

### 7.16.5.1 State control

## DM

Direct mode allows $V_{\text {LCDOUT }}$ to be sourced directly from $V_{D D 2}$. This may be useful in systems where $V_{D D}$ is to be used for $V_{\text {LCD }}$.

## DOF

Display off will turn off all internal analog circuitry that is not required for temperature measurement.
As a consequence the display will be turned off. This mode is only required if temperature measurements are required whilst in power-down mode.

### 7.16.5.2 Oscillator setting

The internal oscillator may be disabled and the source clock for the display derived from the OSC pad. It is important to remember that LCDs are damaged by DC voltages and that the clock, whether derived internally or externally, should never be disabled whilst the display is active. The internal oscillator is switched off during power-down mode.

When using an external clock and disabling it during power-down mode will further reduce the standby current. If it is not possible to disable it externally then it is worth noting that by selecting the internal clock, which is disabled during power-down mode, the same effect may be achieved.

### 7.16.5.3 COG/TCP

The chip may be mounted on either a glass, foil or tape carrier package. For these applications, different organizations of the row pads are required to negate the necessity of routing under the device. The TRS and BRS allow for this swapping. The behaviour of both of these bits is further described in Section 7.15.

### 7.16.6 INSTRUCTION SET

Table 16 Instruction set

| INSTRUCTION | D/C | $\mathbf{R} / \overline{\mathbf{W}}^{(1)}$ | $\mathrm{I}^{2} \mathrm{C}$-BUS COMMAND BYTE |  |  |  |  |  |  |  | I²C-BUS COMMANDS |

| 0 | 0 | 0 | 0 | chip is active and using an external $\mathrm{V}_{\text {LCD }}$ generator attached to $\mathrm{V}_{\text {LCDIN }}$ |

## Note

1. $X=$ don't care state.

## $7.17 \quad \mathrm{I}^{2} \mathrm{C}$-bus interface

### 7.17.1 Characteristics of the I²C-bus

The ${ }^{2} \mathrm{C}$-bus is for bidirectional, two-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

### 7.17.1.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as a control signal. Bit transfer is illustrated in Fig. 15.

### 7.17.1.2 START and STOP conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the START condition (S).
A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P). The START and STOP conditions are illustrated in Fig. 16.

### 7.17.1.3 System configuration

The system configuration is illustrated in Fig.17.

- Transmitter: the device which sends the data to the bus
- Receiver: the device which receives the data from the bus
- Master: the device which initiates a transfer, generates clock signals and terminates a transfer
- Slave: the device addressed by a master
- Multi-master: more than one master can attempt to control the bus at the same time without corrupting the message
- Arbitration: procedure to ensure that, if more than one master simultaneously tries to control the bus, only one is allowed to do so and the message is not corrupted
- Synchronization: procedure to synchronize the clock signals of two or more devices.

### 7.17.1.4 Acknowledge

Each byte of 8 bits is followed by an acknowledge bit. The acknowledge bit is a HIGH signal put on the bus by the transmitter during which time the master generates an extra acknowledge related clock pulse. A slave receiver which is addressed must generate an acknowledge after the reception of each byte. Also a master receiver must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be taken into consideration). A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a STOP condition. Acknowledgement on the $\mathrm{I}^{2} \mathrm{C}$-bus is illustrated in Fig. 18.

Fig. 15 Bit transfer.

Fig. 16 Definition of START and STOP conditions.

Fig. 17 System configuration.

Fig. 18 Acknowledgement on the $\mathrm{I}^{2} \mathrm{C}$-bus.

### 7.17.2 $\mathrm{I}^{2} \mathrm{C}$-bus PROTOCOL

The PCF8535 is a slave receiver/transmitter. If data is to be read from the device the SDAOUT pad must be connected, otherwise SDAOUT is unused.

Before any data is transmitted on the $\mathrm{I}^{2} \mathrm{C}$-bus, the device which should respond is addressed. Four slave addresses, $0111100,0111101,0111110$ and 0111111 are reserved for the PCF8535. The Least Significant Bits (LSBs) of the slave address is set by connecting SA1 and SA0 to either logic $0\left(\mathrm{~V}_{\mathrm{SS}}\right)$ or logic $1\left(\mathrm{~V}_{\mathrm{DD}}\right)$.
A sequence is initiated with a START condition (S) from the $\mathrm{I}^{2} \mathrm{C}$-bus master which is followed by the slave address. All slaves with the corresponding address acknowledge in parallel, all the others will ignore the $\mathrm{l}^{2} \mathrm{C}$-bus transfer.

After the acknowledgement cycle of a write, a control byte follows which defines the destination for the forthcoming data byte and the mode for subsequent bytes. For a read, the PCF8535 will immediately start to output the requested data until a NOT acknowledge is transmitted by the master. The sequence should be terminated by a STOP in the event that no further access is required for the time being, or by a RE-START, should further access be required.

For ease of operation a continuation bit, Co, has been included. This bit allows the user to set-up the chip configuration and transmit RAM data in one access. A data selection bit, $D / \bar{C}$, defines the destination for data. These bits are contained in the control byte. DB5 to DB0 should be set to logic 0 . These bits are reserved for future expansion.

Table 19 Co and $\mathrm{D} / \overline{\mathrm{C}}$ definitions

| BIT | 0/1 | R/प̄ | ACTION |
| :---: | :---: | :---: | :---: |
| Co | 0 | n.a. | last control byte to be sent: only a stream of data bytes are allowed to follow; this stream may only be terminated by a STOP or RE-START condition |
|  | 1 |  | another control byte will follow the data byte unless a STOP or RE-START condition is received |
| D/C | 0 | 0 | data byte will be decoded and used to set up the device |
|  |  | 1 | data byte will return the contents of the currently selected status register |
|  | 1 | 0 | data byte will be stored in the display RAM |
|  |  | 1 | no provision for RAM read back is provided |

An example of a write access is given in Fig.19. Here, multiple instruction data is sent, followed by multiple display bytes.
An example of a read access is given in Fig.20.

Fig. 19 Master transmits to slave receiver; write mode.

Fig. 20 Master reads a slaves' status register.

## 8 LIMITING VALUES (PROVISIONAL)

In accordance with the Absolute Maximum Rating System (IEC 134); notes 1, 2 and 3.

| SYMBOL | PARAMETER | MIN. | MAX. | UNIT |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{DD}}$ | supply voltage | -0.5 | +7.0 | V |
| $\mathrm{I}_{\mathrm{DD}}$ | supply current | -50 | +50 | mA |
| $\mathrm{~V}_{\mathrm{LCD}}$ | LCD supply voltage | -0.5 | +17.0 | V |
| $\mathrm{I}_{\mathrm{LCD}}$ | LCD supply current | -50 | +50 | mA |
| $\mathrm{I}_{\mathrm{SS}}$ | negative supply current | -50 | +50 | mA |
| $\mathrm{~V}_{\mathrm{I}} / \mathrm{V}_{\mathrm{O}}$ | input/output voltage (any input/output) | -0.5 | $\mathrm{~V}_{\mathrm{DD}}+0.5$ | V |
| $\mathrm{I}_{\mathrm{I}}$ | DC input current | -10 | +10 | mA |
| $\mathrm{I}_{\mathrm{O}}$ | DC output current | -10 | +10 | mA |
| $\mathrm{P}_{\text {tot }}$ | total power dissipation per package | - | 300 | mW |
| $\mathrm{P} /$ out | power dissipation per output | - | 30 | mW |
| $\mathrm{~T}_{\text {amb }}$ | ambient temperature | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | storage temperature | -65 | +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{j}(\text { max }}$ | maximum junction temperature | - | 150 | ${ }^{\circ} \mathrm{C}$ |

## Notes

1. Stresses above these values listed may cause permanent damage to the device.
2. Parameters are valid over the operating temperature range unless otherwise specified. All voltages are referenced to $\mathrm{V}_{\mathrm{SS}}$ unless otherwise specified.
3. $\mathrm{V}_{\mathrm{SS}}=0 \mathrm{~V}$.

## 9 HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is recommended to take normal precautions appropriate to handling MOS devices (see "Handling MOS Devices").

## 10 DC CHARACTERISTICS

$\mathrm{V}_{\mathrm{DD}}=4.5$ to $5.5 \mathrm{~V} ; \mathrm{V}_{\mathrm{SS}}=0 \mathrm{~V} ; \mathrm{V}_{\mathrm{LCD}}=4.5$ to $16.0 \mathrm{~V} ; \mathrm{T}_{\mathrm{amb}}=-40$ to $+85^{\circ} \mathrm{C}$; unless otherwise specified.

| SYMBOL | PARAMETER | CONDITIONS | MIN. | TYP. | MAX. | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Notes

1. LCD outputs are open-circuit, inputs at $V_{D D}$ or $V_{S S}$, bus inactive, $f_{\mathrm{OSC}}=$ typical internal oscillator frequency.
2. Conditions are: $\mathrm{V}_{\mathrm{DD} 1}$ to $\mathrm{V}_{\mathrm{DD} 3}=5.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{LCD}}=12.0 \mathrm{~V}$ and external $\mathrm{V}_{\mathrm{LCD}}$.
3. Power-down mode. During power-down all static currents are switched off.
4. Conditions are: $\mathrm{V}_{\mathrm{DD} 1}$ to $\mathrm{V}_{\mathrm{DD} 3}=5.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{LCD}}=\mathrm{V}_{\mathrm{DD} 2}$ and external $\mathrm{V}_{\mathrm{LCD}}$.
5. Internal $V_{\text {LCD }}$ generation or external $V_{\text {LCD }}$.
6. Conditions are: $\mathrm{V}_{\mathrm{DD} 1}$ to $\mathrm{V}_{\mathrm{DD} 3}=5.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{LCD}}=12.0 \mathrm{~V}$ and voltage multiplier $=3 \mathrm{~V}_{\mathrm{DD}}$.
7. $\mathrm{I}_{\mathrm{LCD}}=10 \mu \mathrm{~A}$. Outputs tested one at a time.

## 11 AC CHARACTERISTICS

$\mathrm{V}_{\mathrm{DD}}=4.5$ to $5.5 \mathrm{~V} ; \mathrm{V}_{\mathrm{SS}}=0 \mathrm{~V} ; \mathrm{V}_{\mathrm{LCD}}=4.5$ to $16.0 \mathrm{~V} ; \mathrm{T}_{\mathrm{amb}}=-40$ to $+85^{\circ} \mathrm{C}$; unless otherwise specified.

| SYMBOL | PARAMETER | CONDITIONS | MIN. | TYP. | MAX. | UNIT |

| $\mathrm{t}_{\text {BUF }}$ | bus free time between a STOP and START condition |  | 1.3 | - | - | $\mu \mathrm{s}$ |

## Notes

1. $V_{D D 1}$ to $V_{D D 3}=5 \mathrm{~V}$.
2. Decoupling capacitor $\mathrm{V}_{\mathrm{LCD}}$ and $\mathrm{V}_{\mathrm{SS}}=100 \mathrm{nF}$ (higher capacitor size increases $\mathrm{t}_{\mathrm{SU} \text {;RESL }}$ and higher $\mathrm{V}_{\mathrm{DD} 1}$ to $\mathrm{V}_{\mathrm{DD} 3}$ reduces tsu;RESL).
3. All timing values are valid within the operating supply voltage and ambient temperature range and are referenced to $\mathrm{V}_{\mathrm{IL}}$ and $\mathrm{V}_{\mathrm{IH}}$ with an input voltage swing of $\mathrm{V}_{\mathrm{SS}}$ to $\mathrm{V}_{\mathrm{DD}}$.
4. $\mathrm{C}_{\mathrm{b}}=$ total capacitance of one bus line in pF .

## Note

1. Assumes the display RAM was previously empty.

The pinning of the PCF8535 is optimized for single plane wiring e.g. for chip-on-glass display modules. Display size: $65 \times 133$ pixels.

Fig. 23 Application diagram (COG).

The required minimum value for the external capacitors in an application with the PCF8535 are:
$C_{\text {ext }}$ for $\mathrm{V}_{\mathrm{LCD}}, \mathrm{V}_{\mathrm{SS} 1}$ and $\mathrm{V}_{\mathrm{SS} 2}=100 \mathrm{nF}$ (min.) (recommended 470 nF to $1 \mu \mathrm{~F}$ ); $\mathrm{C}_{e x t}$ for $\mathrm{V}_{\mathrm{DD} 1}$ to $\mathrm{V}_{\mathrm{DD} 3}, \mathrm{~V}_{\mathrm{SS} 1}$ and $\mathrm{V}_{\mathrm{SS} 2}=470 \mathrm{nF}$ (recommended capacitor larger than the capacitor for $\mathrm{V}_{\mathrm{LCD}}, \mathrm{V}_{\mathrm{SS} 1}$ and $\mathrm{V}_{\mathrm{SS} 2}$ ).

Higher capacitor values are recommended for ripple reduction.
For COG applications the recommended ITO track resistance is to be minimized for the I/O and supply connections. Maximum values for supply tracks ( $\mathrm{R}_{\text {supply }}$ ) are $120 \Omega$. Maximum values for the common resistance to the source, ( $\mathrm{R}_{\text {common }}$ ) are $120 \Omega$. Higher track resistance reduces performance and increases current consumption.

Three I/O lines are required for the COG module; SDA, SCL and RES (optional). Other signals may be fixed on the module to appropriate levels. $\mathrm{R}_{\mathrm{I} / \mathrm{O}}$ should also be minimized. In particular, if the $\mathrm{I}^{2} \mathrm{C}$-bus acknowledge or temperature read back is required, the $R_{I / O}$ for the SDA line must be carefully considered in conjunction with the value of the external pull-up resistor.

## 14 BONDING PAD LOCATIONS

Table 22 Bonding pad locations
All $x$ and $y$ coordinates are referenced to the centre of the chip (dimensions in $\mu \mathrm{m}$; see Fig.27).

Table 24 Bonding pads

| PAD | SIZE | UNIT |
| :--- | :--- | :--- |
| Pad pitch | minimum 70 | $\mu \mathrm{~m}$ |
| Pad size; Al | $62 \times 100$ | $\mu \mathrm{~m}$ |
| CBB opening | $36 \times 76$ | $\mu \mathrm{~m}$ |
| Bump dimensions | $50 \times 90 \times 17.5( \pm 5)$ | $\mu \mathrm{m}$ |
| Wafer thickness <br> (including bumps) | maximum 381 | $\mu \mathrm{~m}$ |

Fig. 24 Shape of alignment mark.

Fig. 26 Bonding pads.

The position of the bonding pads is not to scale.
Fig. 27 Bonding pad location (viewed from bump side).

## 15 DEVICE PROTECTION DIAGRAM

Fig. 28 Device diode protection diagram.

## 16 TRAY INFORMATION

The dimensions are given in Table 25.
Fig. 29 Tray details.

The orientation of the IC in a pocket is indicated by the position of the IC type name on the die surface with respect to the chamfer on the upper left corner of the tray. Refer to the bonding pad location diagram for the orientating and position of the type name on the die surface.

Fig. 30 Tray alignment.

Table 25 Dimensions

| DIM. | DESCRIPTION | VALUE |
| :--- | :--- | :--- |
| A | pocket pitch in x direction | 14.88 mm |
| B | pocket pitch in y direction | 4.06 mm |
| C | pocket width in x direction | 12.76 mm |
| D | pocket width in $y$ direction | 2.46 mm |
| E | tray width in x direction | 50.8 mm |
| F | tray width in y direction | 50.8 mm |
| x | number of pockets in x direction | 3 |
| y | number of pockets in y direction | 11 |

## 17 DEFINITIONS

| Data sheet status |  |
| :--- | :--- |
| Objective specification | This data sheet contains target or goal specifications for product development. |
| Preliminary specification | This data sheet contains preliminary data; supplementary data may be published later. |
| Product specification | This data sheet contains final product specifications. |
| Limiting values | Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or <br> more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation <br> of the device at these or at any other conditions above those given in the Characteristics sections of the specification <br> is not implied. Exposure to limiting values for extended periods may affect device reliability. |
| Application information |  |
| Where application information is given, it is advisory and does not form part of the specification. |  |

## 18 LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

## 19 PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips $I^{2} \mathrm{C}$ components conveys a license under the Philips' $I^{2} \mathrm{C}$ patent to use the components in the $\mathrm{I}^{2} \mathrm{C}$ system provided the system conforms to the $\mathrm{I}^{2} \mathrm{C}$ specification defined by Philips. This specification can be ordered using the code 939839340011.

## 20 BARE DIE DISCLAIMER

All die are tested and are guaranteed to comply with all data sheet limits up to the point of wafer sawing for a period of ninety (90) days from the date of Philips' delivery. If there are data sheet limits not guaranteed, these will be separately indicated in the data sheet. There is no post waffle pack testing performed on individual die. Although the most modern processes are utilized for wafer sawing and die pick and place into waffle pack carriers, Philips Semiconductors has no control of third party procedures in the handling, packing or assembly of the die. Accordingly, Philips Semiconductors assumes no liability for device functionality or performance of the die or systems after handling, packing or assembly of the die. It is the responsibility of the customer to test and qualify their application in which the die is used.
