

**384-OUTPUT TFT-LCD SOURCE DRIVER  
(COMPATIBLE WITH 256-GRAY SCALES)****DESCRIPTION**

The μPD16750 is a source driver for TFT-LCDs capable of dealing with 256-gray scales. Data input is based on digital input configured as 8 bits by 6 dots (2 pixels), which can realize a full-color display of 16,777,216 colors by output of 256 values  $\gamma$ -corrected by an internal D/A converter and 8-by-2 external power modules. Because the output dynamic range is as large as  $V_{DD2} - 0.2$  V to  $V_{SS2} + 0.2$  V, level inversion operation of the LCD's common electrode is rendered unnecessary. Also, to be able to deal with dot-line inversion, n-line inversion and column line inversion when mounted on a single side, this source driver is equipped with a built-in 8-bit D/A converter circuit whose odd output pins and even output pins respectively output gray scale voltages of differing polarity. Assuring a maximum clock frequency of 40 MHz when driving at 3.0 V, this driver is applicable to XGA-standard TFT-LCD panels and SXGA TFT-LCD panels. This driver is applicable to SXGA TFT-LCD panels by input display signal 2 systems (Clock divide).

**FEATURES**

- CMOS level input
- 384 outputs
- Input of 8 bits (gradation data) by 6 dots
- Capable of outputting 256 values by means of 8-by-2 external power modules (16 units) and a D/A converter
- Output dynamic range:  $V_{DD2} - 0.2$  V to  $V_{SS2} + 0.2$  V
- High-speed data transfer:  $f_{CLK} = 40$  MHz (internal data transfer speed when operating at 3.0 V)
- Apply for dot-line inversion, n-line inversion and column line inversion
- Output voltage polarity inversion function (POL)
- Display data inversion function (POL21/22)
- Logic power supply voltage ( $V_{DD1}$ ) :  $3.3\text{ V} \pm 0.3\text{ V}$
- Driver power supply voltage ( $V_{DD2}$ ) :  $9.0\text{ V} \pm 0.5\text{ V}$
- Low power control function (LPC)

#### 4. PIN FUNCTIONS

Pin Symbol	Pin Name	Description
S <sub>1</sub> to S <sub>384</sub>	Driver output	The D/A converted 256-gray-scale analog voltage is output.
D <sub>00</sub> to D <sub>07</sub>	Display data input	The display data is input with a width of 48 bits, viz., the gray scale data (8 bits) by 6 dots (2 pixels). D <sub>x0</sub> : LSB, D <sub>x7</sub> : MSB
D <sub>10</sub> to D <sub>17</sub>		
D <sub>20</sub> to D <sub>27</sub>		
D <sub>30</sub> to D <sub>37</sub>		
D <sub>40</sub> to D <sub>47</sub>		
D <sub>50</sub> to D <sub>57</sub>		
R/L	Shift direction control input	These refer to the start pulse input/output pins when driver ICs are connected in cascade. The shift directions of the shift registers are as follows. R/L = H : STHR input, S <sub>1</sub> → S <sub>384</sub> , STHL output R/L = L : STHL input, S <sub>384</sub> → S <sub>1</sub> , STHR output
STHR	Right shift start pulse input/output	R/L = H : Becomes the start pulse input pin. R/L = L : Becomes the start pulse output pin.
STHL	Left shift start pulse input/output	R/L = H : Becomes the start pulse output pin. R/L = L : Becomes the start pulse input pin.
CLK	Shift clock input	Refers to the shift register's shift clock input. The display data is incorporated into the data register at the rising edge of the 64th clock after the start pulse input, the start pulse output reaches the high level, thus becoming the start pulse of the next-level driver.
STB	Latch input	The contents of the data register are transferred to the latch circuit at the rising edge. And, at the falling edge, the gray scale voltage is supplied to the driver. It is necessary to ensure input of one pulse per horizontal period.
POL	Polarity input	POL = L : The S <sub>2n-1</sub> output uses V <sub>0</sub> to V <sub>7</sub> as the reference supply. The S <sub>2n</sub> output uses V <sub>8</sub> to V <sub>15</sub> as the reference supply. POL = H : The S <sub>2n-1</sub> output uses V <sub>8</sub> to V <sub>15</sub> as the reference supply. The S <sub>2n</sub> output uses V <sub>0</sub> to V <sub>7</sub> as the reference supply. S <sub>2n-1</sub> indicates the odd output; and S <sub>2n</sub> indicates the even output. Input of the POL signal is allowed the setup time(t <sub>POL-STB</sub> ) with respect to STB's rising edge.
POL21 POL22	Data inversion	Data inversion can invert when display data is loaded. POL21/22 = H : Data inversion loads display data after inverting it. POL21/22 = L : Data inversion does not invert input data. POL21: D <sub>00</sub> to D <sub>07</sub> , D <sub>10</sub> to D <sub>17</sub> , D <sub>20</sub> to D <sub>27</sub> POL22: D <sub>30</sub> to D <sub>37</sub> , D <sub>40</sub> to D <sub>47</sub> , D <sub>50</sub> to D <sub>57</sub>
LPC	Low power control input	The output buffer constant current source is blocked, reducing current consumption. In lower power mode (LPC = L: DC-level input possible), the ordinary static current consumption can be reduced by approx. 33 %.
V <sub>0</sub> to V <sub>15</sub>	$\gamma$ -corrected power supplies	Input the $\gamma$ -corrected power supplies from outside by using operational amplifier. Make sure to maintain the following relationships. During the gray scale voltage output, be sure to keep the gray scale level power supply at a constant level. V <sub>DD2</sub> - 0.2 V > V <sub>0</sub> > V <sub>1</sub> > V <sub>2</sub> > V <sub>3</sub> > V <sub>4</sub> > V <sub>5</sub> > V <sub>6</sub> > V <sub>7</sub> > 0.5 V <sub>DD2</sub> 0.5 V <sub>DD2</sub> - 0.3 V > V <sub>8</sub> > V <sub>9</sub> > V <sub>10</sub> > V <sub>11</sub> > V <sub>12</sub> > V <sub>13</sub> > V <sub>14</sub> > V <sub>15</sub> > V <sub>SS2</sub> + 0.2 V
V <sub>DD1</sub>	Logic power supply	3.3 V ± 0.3 V
V <sub>DD2</sub>	Driver power supply	9.0 V ± 0.5 V
V <sub>SS1</sub>	Logic ground	Grounding
V <sub>SS2</sub>	Driver ground	Grounding

- Cautions**
1. The power start sequence must be  $V_{DD1}$ , logic input, and  $V_{DD2}$  &  $V_0$  to  $V_{15}$  in that order.  
Reverse this sequence to shut down (Simultaneous power application to  $V_{DD2}$  and  $V_0$  to  $V_{15}$  is possible.).
  2. To stabilize the supply voltage, please be sure to insert a  $0.1\text{-}\mu\text{F}$  bypass capacitor between  $V_{DD1}$ - $V_{SS1}$  and  $V_{DD2}$ - $V_{SS2}$ . Furthermore, for increased precision of the D/A converter, insertion of a bypass capacitor of about  $0.01\text{ }\mu\text{F}$  is also advised between the  $\gamma$ -corrected power supply terminals ( $V_0$ ,  $V_1$ ,  $V_2$ ,...,  $V_{15}$ ) and  $V_{SS2}$ .

## 5. RELATIONSHIP BETWEEN INPUT DATA AND OUTPUT VOLTAGE VALUE

This product incorporates a 8-bit D/A converter whose odd output pins and even output pins output respectively gray scale voltages of differing polarity with respect to the LCD's counter electrode (common electrode) voltage. The D/A converter consists of ladder resistors.

Figure 5-1 shows the relationship between the driving voltages such as liquid-crystal driving voltages  $V_{DD2}$  and  $V_{SS2}$ , common electrode potential  $V_{COM}$ , and  $\gamma$ -corrected voltages  $V_0$  to  $V_{15}$  and the input data. Be sure to maintain the voltage relationships of

$$V_{DD2} - 0.2 \text{ V} > V_0 > V_1 > V_2 > V_3 > V_4 > V_5 > V_6 > V_7 > 0.5 V_{DD2},$$

$$0.5 V_{DD2} - 0.3 \text{ V} > V_8 > V_9 > V_{10} > V_{11} > V_{12} > V_{13} > V_{14} > V_{15} > V_{SS2} + 0.2 \text{ V}$$

Figures 5-2 and 5-3 show the relationship between the input data and the output voltage. This driver IC is designed for only single-sided mounting. Therefore, please do not use it for  $\gamma$ -corrected power supply level inversion in double-sided mounting.

Caution There is no connection between V<sub>7</sub> and V<sub>8</sub> in the chip.

Figure 5–3. Relationship between Input Data and Output Voltage (1/4)

0.5 V<sub>DD2</sub> – 0.3 V > V<sub>8</sub> > V<sub>9</sub> > V<sub>10</sub> > V<sub>11</sub> > V<sub>12</sub> > V<sub>13</sub> > V<sub>14</sub> > V<sub>15</sub> > V<sub>SS2</sub> + 0.2 V, POL21/22 = L

The circuit diagram illustrates the logic flow from inputs V<sub>8</sub> through V<sub>15</sub> to the output V<sub>0''</sub>. Each input V<sub>i</sub> is connected to a switch f<sub>i</sub>, which connects its input to a common bus. The bus then connects to the truth table and the resistor table.

## 10. RECOMMENDED MOUNTING CONDITIONS

The following conditions must be met for mounting conditions of the  $\mu$  PD16750.

For more details, refer to the **Semiconductor Device Mounting Technology Manual (C10535E)**.

Please consult with our sales offices in case other mounting process is used, or in case the mounting is done under different conditions.

$\mu$ PD16750N-xxx : TCP (TAB Package)

Mounting Condition	Mounting Method	Condition
Thermocompression	Soldering	Heating tool 300 to 350°C, heating for 2 to 3 seconds : pressure 100g (per solder)
	ACF (Adhesive Conductive Film)	Temporary bonding 70 to 100°C : pressure 3 to 8 kg/cm <sup>2</sup> : time 3 to 5 sec. Real bonding 165 to 180°C: pressure 25 to 45 kg/cm <sup>2</sup> : time 30 to 40 sec. (When using the anisotropy conductive film SUMIZAC1003 of Sumitomo Bakelite,Ltd).

**Caution** To find out the detailed conditions for mounting the ACF part, please contact the ACF manufacturing company. Be sure to avoid using two or more mounting methods at a time.

**NOTES FOR CMOS DEVICES****① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

**② HANDLING OF UNUSED INPUT PINS FOR CMOS**

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V<sub>DD</sub> or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

**③ STATUS BEFORE INITIALIZATION OF MOS DEVICES**

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

- NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.
- Descriptions of circuits, software, and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software, and information in the design of the customer's equipment shall be done under the full responsibility of the customer. NEC Corporation assumes no responsibility for any losses incurred by the customer or third parties arising from the use of these circuits, software, and information.
- While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.
- NEC devices are classified into the following three quality grades:  
"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.
