## M377S1620ET3 SDRAM DIMM (Intel 1.2 ver. Base)

16Mx72 SDRAM DIMM with PLL & Register based on 16Mx4, 4Banks, 4K Ref., 3.3V Synchronous DRAMs with SPD

### GENERAL DESCRIPTION

The Samsung M377S1620ET3 is a 16M bit x 72 Synchronous Dynamic RAM high density memory module. The Samsung M377S1620ET3 consists of eighteen CMOS 16Mx4 bit Synchronous DRAMs in TSOP-II 400mil packages, three 18-bits Drive ICs for input control signal, one PLL in 24-pin TSSOP package for clock and one 2K EEPROM in 8-pin TSSOP package for Serial Presence Detect on a 168-pin glass-epoxy substrate. Two 0.22uF and one 0.0022uF decoupling capacitors are mounted on the printed circuit board in parallel for each SDRAM. The M377S1620ET3 is a Dual In-line Memory Module and is intended for mounting into 168-pin edge connector sockets.

Synchronous design allows precise cycle control with the use of system clock. I/O transactions are possible on every clock cycle. Range of operating frequencies, programmable latencies allows the same device to be useful for a variety of high bandwidth, high performance memory system applications.

## PIN CONFIGURATION DESCRIPTION

Pin	Name	Input Function
CLK	<i>System clock</i>	Active on the positive going edge to sample all inputs.
$\overline{\text{CS}}$	<i>Chip select</i>	Disables or enables device operation by masking or enabling all inputs except CLK, CKE and DQM
CKE	<i>Clock enable</i>	Masks system clock to freeze operation from the next clock cycle. CKE should be enabled at least one cycle prior to new command. Disable input buffers for power down in standby. CKE should be enabled 1CLK+tss prior to valid command.
A0 ~ A11	<i>Address</i>	Row/column addresses are multiplexed on the same pins. Row address : RA0 ~ RA11, Column address : CA0 ~ CA9
BA0 ~ BA1	<i>Bank select address</i>	Selects bank to be activated during row address latch time. Selects bank for read/write during column address latch time.
$\overline{\text{RAS}}$	<i>Row address strobe</i>	Latches row addresses on the positive going edge of the CLK with $\overline{\text{RAS}}$ low. Enables row access & precharge.
$\overline{\text{CAS}}$	<i>Column address strobe</i>	Latches column addresses on the positive going edge of the CLK with $\overline{\text{CAS}}$ low. Enables column access.
$\overline{\text{WE}}$	<i>Write enable</i>	Enables write operation and row precharge. Latches data in starting from $\overline{\text{CAS}}$ , $\overline{\text{WE}}$ active.
DQM0 ~ 7	<i>Data input/output mask</i>	Makes data output Hi-Z, tshz after the clock and masks the output. Blocks data input when DQM active. (Byte masking)
REGE	<i>Register enable</i>	The device operates in the transparent mode when REGE is low. When REGE is high, the device operates in the registered mode. In registered mode, the Address and control inputs are latched if CLK is held at a high or low logic level. the inputs are stored in the latch/flip-flop on the rising edge of CLK. REGE is tied to VDD through 10K ohm Resistor on PCB. So if REGE of module is floating, this module will be operated as registered mode.
DQ0 ~ 63	<i>Data input/output</i>	Data inputs/outputs are multiplexed on the same pins.
CB0 ~ 7	<i>Check bit</i>	Check bits for ECC.
VDD/VSS	<i>Power supply/ground</i>	Power and ground for the input buffers and the core logic.

\* Note  
 1. Unused clock termination : 10Ω and 12pF  
 2. The actual values of Cb will depend upon the PLL chosen.

STANDARD TIMING DIAGRAM WITH PLL & REGISTER (CL=2, BL=4)

**\*1. Register Input**

**\*2. Register Output**

**\*3. SDRAM**

td, tr = Delay of register (74ALVC162835)

**Notes :** 1. In case of module timing, command cycles delayed 1CLK with respect to external input timing at the address and input signal because of the buffering in register (74ALVC162835). Therefore, Input/Output signals of read/write function should be issued 1CLK earlier as compared to Unbuffered DIMMs.

2. D<sub>IN</sub> is to be issued 1clock after write command in external timing because D<sub>IN</sub> is issued directly to module.

1. The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time and then rounding off to the next higher integer.
  2. Minimum delay is required to complete write.
  3. All parts allow every cycle column address change.
  4. In case of row precharge interrupt, auto precharge and read burst stop.
  5. In 100MHz and below 100MHz operating conditions,  $t_{RDL}=1CLK$  and  $t_{DAL}=1CLK + 20ns$  is also supported. SAMSUNG recommends  $t_{RDL}=2CLK$  and  $t_{DAL}=2CLK + t_{RP}$ .

- Notes :**
- Parameters depend on programmed CAS latency.
  - If clock rising time is longer than 1ns,  $(tr/2-0.5)ns$  should be added to the parameter.
  - Assumed input rise and fall time ( $tr$  &  $tf$ ) = 1ns.  
If  $tr$  &  $tf$  is longer than 1ns, transient time compensation should be considered, i.e.,  $[(tr + tf)/2-1]ns$  should be added to the parameter.

2. MRS can be issued only at all banks precharge state.

A new command can be issued after 2 clock cycles of MRS.

The automatical precharge without row precharge command is meant by "Auto".

Auto/self refresh can be issued only at all banks precharge state.

4. BA<sub>0 ~ BA<sub>1</sub></sub> : Bank select addresses.If both BA<sub>0</sub> and BA<sub>1</sub> are "Low" at read, write, row active and precharge, bank A is selected.If both BA<sub>0</sub> is "Low" and BA<sub>1</sub> is "High" at read, write, row active and precharge, bank B is selected.If both BA<sub>0</sub> is "High" and BA<sub>1</sub> is "Low" at read, write, row active and precharge, bank C is selected.If both BA<sub>0</sub> and BA<sub>1</sub> are "High" at read, write, row active and precharge, bank D is selected.If A<sub>10/AP</sub> is "High" at row precharge, BA<sub>0</sub> and BA<sub>1</sub> is ignored and all banks are selected.

5. During burst read or write with auto precharge, new read/write command can not be issued.

Another bank read/write command can be issued after the end of burst.

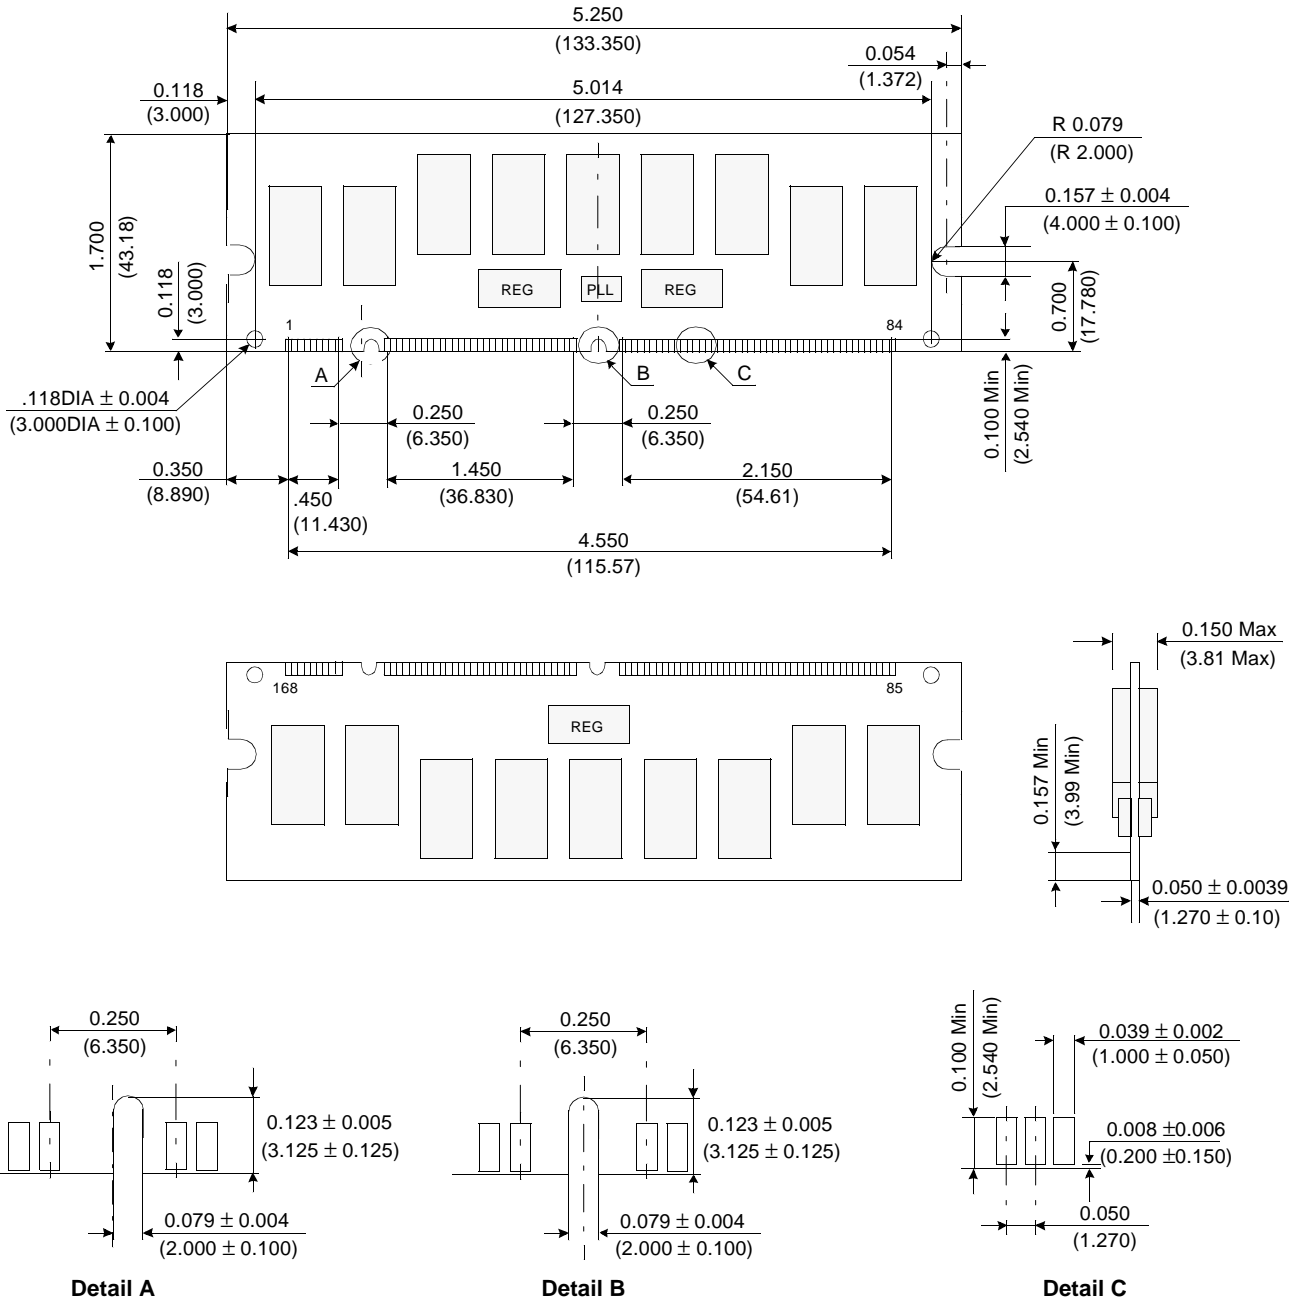

New row active of the associated bank can be issued at t<sub>RP</sub> after the end of burst.

6. Burst stop command is valid at every burst length.

7. DQM sampled at positive going edge of a CLK and masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
