

Features

- 2.5 to 5.5V supply voltage operating range.
- Low current consumption: 1mA in operation,
- 50 kHz or 100kHz operation frequency .
- Built-in maximum duty control.
- Push-pull output.
- Built-in soft start circuit.
- Built-in auto-discharge function.

Applications

- Digital Still Cameras flash unit

General Description

The AT1453 is a charger control IC for Photoflash capacitor with soft start function, adjustable maximum duty cycle and auto-discharge (soft start capacitor) circuit. Adjustable soft start is programmed with an external capacitor on SS pin. The control technique allows for the use of external resistor to change the switching duty and use of transformer to control the input current. A logic high on the CHARGE pin initiates charging, while the READY pin signals that the capacitor is fully charged. It is ideal for DSC flash unit.

** Protected by U.S. Patent #6,724,989*

Pin Description

Pin No.	Symbol	I/O	Description
1	CHARGE	I	Charge enable input
2	FB	I	Error amplifier input
3	DUTY	I	Duty control input
4	GND	-	Ground
5	OUT	O	Push-pull output
6	VCC	-	Power supply
7	READY	O	Charge ready open drain output
8	SS	I	Soft-start setting

Absolute Maximum Ratings

Parameter	Condition	Rated Value		Unit
		Min.	Max.	
Power Supply Voltage	—	-	+6.5	V
Source Average Current of OUT	—	-	-50	mA
Sink Average Current of OUT	—	-	50	mA
Input Voltage to Error Amplifier	—	-	6.5	V
Continuous power dissipation	TSSOP8 (T _a =+25°C)	-	450	mW
	SOP8 (T _a =+25°C)	-	500	mW
Operating temperature	—	-30	+85	°C
Junction temperature	—	-	+125	°C
Storage temperature	—	-40	+150	°C
Lead temperature	—	-	+300	°C

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Recommended Operating Conditions

(T_a=+25°C)

Parameter	Symbol	Values			Unit
		Min.	Typ.	Max.	
Power supply voltage	V _{CC}	2.5	--	5.5	V
Operating temperature	T _{OP}	-30	+25	+85	°C

Electrical Characteristics

(VCC = 3.3V, T_a = +25°C, unless otherwise noted.)

Parameter		Symbol	Condition	Values			Unit
				Min.	Typ.	Max.	
Entire device	Input Supply Range	V _{CC}		2.5	--	5.5	V
	Feedback Voltage	V _{FB}	T _a = +25°C	1.080	1.100	1.120	V
	Reference variation with Temperature		T _a = -30°C to +85°C	-2	-	2	%
	Feedback Voltage line-regulation	V _{FB-Line}	VCC=2.5V to 5.5V	-5	1	5	mV
	Standby current	I _{CCS}	CHARGE=GND	-	-	400	μA
	Operating Current	I _{CC}	Duty=50%, f _{OSC} =50KHz	-	1.0	-	mA
Oscillator	Frequency	fosc	A	40	50	60	kHZ
			B	90	100	110	kHZ
Soft-Start and Duty Section	Threshold voltage of SS	V _{SS_0}	Duty Cycle=0%	-	0.3	-	V
	Threshold voltage of SS	V _{SS_100}	Duty Cycle=100%	-	1.1	-	V
	Charging current	I _{SS}	V _{SS} =0V	0.7	1.0	1.5	μA
	Maximum duty cycle	T _{DUTY}		80	83	90	%
Output Section	Output source current	I _{SOURCE}	Duty ≥ 95%, OUT=0V	-	-130	-80	mA
	Output sink current	I _{SINK}	Duty ≤ 5%, OUT=5V	65	100	-	mA
	Output ON resistor	R _{OH}	OUT = -15mA	-	18	30	Ω
	Output OFF resistor	R _{OL}	OUT = 15mA	-	16	25	Ω
Charge ON/OFF Section	Active mode Threshold	V _{ONH}		2.0			V
	Disable mode Threshold	V _{ONL}				0.8	V

Timing Chart

AT1453 Charge Toggling Refresh Mode

DUTY Setting

The DUTY resistor selection depends on Duty Cycle , choose the component using the following equation:

$$V_{DUTY} (V) = 0.3 + \frac{DUTY}{1.15}$$
$$R_{DUTY} (K\Omega) = \frac{15}{\left(\frac{1.1}{V_{DUTY}}\right) - 1.073}$$

Example:

Set duty cycle is 50%

$$V_{DUTY} = 0.3 + \frac{0.5}{1.15} = 0.734$$
$$R_{DUTY} = \frac{15}{\left(\frac{1.1}{0.734}\right) - 1.073} \approx 35.2K\Omega$$

Output Voltage Setting

$$V_{OUT} = \frac{R1 + R2}{R2} \times V_{FB}$$

$$V_{FB} = 1.1V$$

Soft-Start Setting

The soft start operation is determined by the capacitor connected to the SS terminal. It can calculate the soft start time $T_s(s)$.

$$C \times \frac{\Delta V}{\Delta t} = I \rightarrow C \times \frac{V_{DUTY} - 0.3}{\Delta t} = 1\mu A$$

$$T_s(s) = (V_{DUTY} - 0.3) \times C(\mu F)$$

Example: (Fig C)

$R5=47K \rightarrow V_{DUTY}=0.790V$
 $\rightarrow T_s(s)=(0.790-0.3) \times I=0.49(sec)$

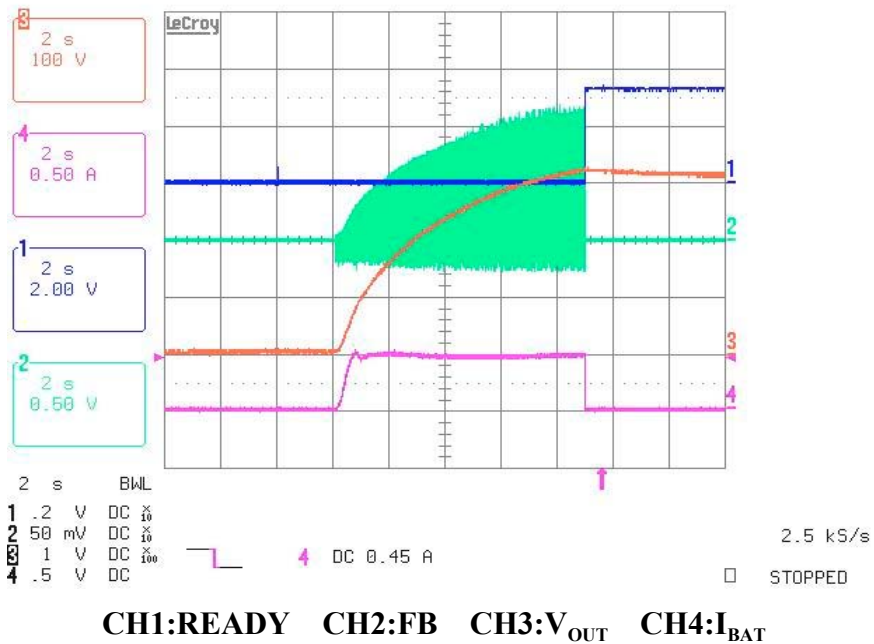

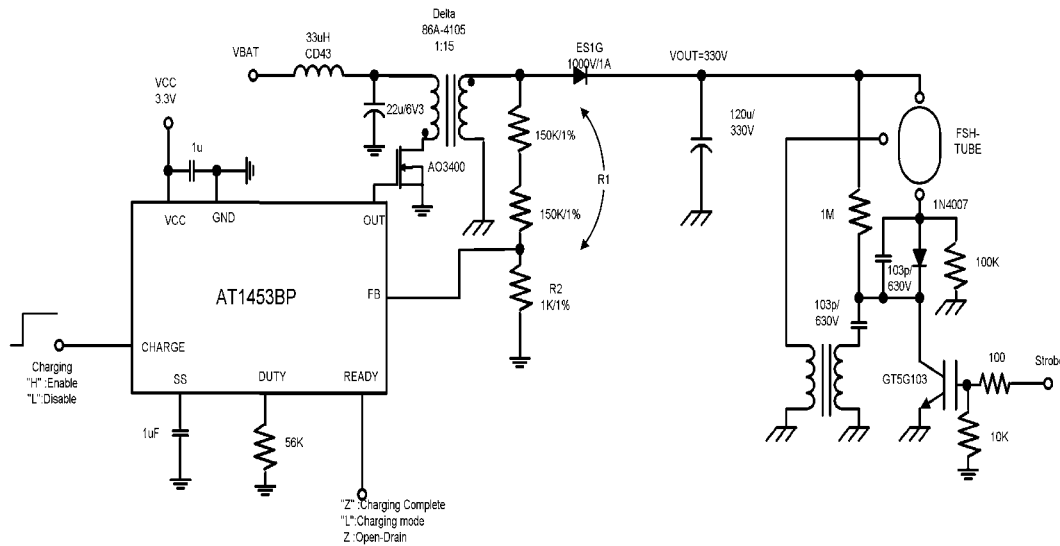

CH1:V_{OUT} CH2:SS CH3:DUTY CH4:I_{BAT}

Reduce the Output Voltage Decay

The output voltage is sensed by a voltage divider connecting to the anode of the rectifying diode. The voltage sensing path is cut off when charging complete to minimize the output voltage decay.

Application Information

Photoflash Capacitor Charger Charge Time:

The energy stored in the output capacitor is:

$$E = \frac{C \times V^2}{2}$$

The output power required by the flyback converter to charge the capacitor in a period of time is:

$$P_{CAP} = \frac{E}{t} = \frac{C \times V^2}{2 \times t} = V_{IN} \times I_{AVG} \times D \times \eta$$

The approximate charge time for the converter circuit is:

$$t = \frac{C_{OUT} \times V_{OUT}^2}{2 \times V_{IN} \times I_{AVG} \times D \times \eta}$$

Where:

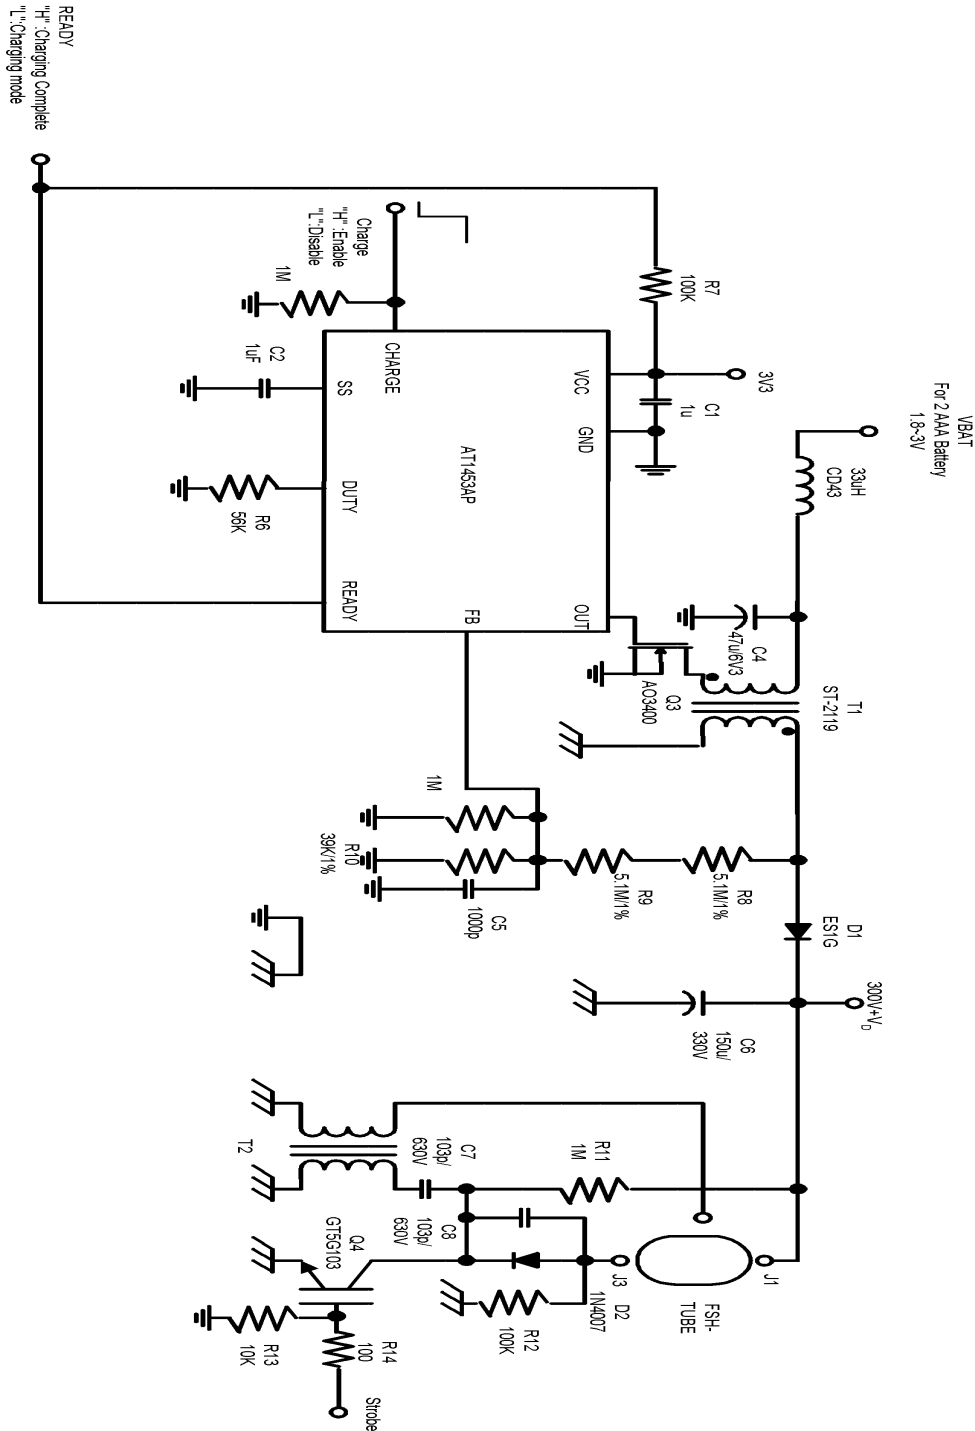

- fs= Switching frequency
- D= Maximum Duty Cycle
- L_{PRI}= Primary Inductance
- η= Efficiency

$$I_{AVG} = I_{BAT} = \frac{I_{PK} \times D}{2}$$

$$I_{PK} = \frac{V_{IN} \times D}{L_{PRI} \times f_s}$$

Avoid the Feedback Resistor Leakage Current:
