

TENTATIVE TOSHIBA BIPOLAR LINEAR INTEGRATED CIRCUIT SILICON MONOLITHIC

TA1310N

NTSC VIDEO, CHROMA, DEFLECTION, AND DEC. DISTORTION COMPENSATION IC (FOR YUV INTERFACE AND ACB WITH)

TA1310N is Video Chroma and deflection signal.
Processing IC for NTSC. On a 56-pin shrink DIP package.
TA1310N has deflection distortion compensation.
TA1310N uses an I²C Bus controls for controllings and settings.

Weight : 5.55 g (Typ.)

FEATURES

Video Signal Processing

- Built-in Y delay line
- Black stretch
- DC restoration ratio compensation
- Aperture controlled sharpness
- Output for velocity scan modulation (VSM)
- White peak suppression (WPS)

Chroma Signal Processing

- Built-in chroma BPF / TOF
- R-Y and B-Y outputs
- Color / BW situation output by read bus

980910EBA1

- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.

Sync Signal Processing

- Counts down $32 f_H$
- Dual AFC
- Vertical AGC
- HD and VD outputs
- Vertical frequency fixed mode
- Horizontal and Vertical position alignment
- DC outputs for vertical centering

Text Signal Processing

- Analog RGB inputs
- Digital RGB inputs
- Halftone switch (YM)
- Cutoff and drive alignment
- YUV inputs

Deflection Correction Function

- Horizontal and Vertical amplitude adjustment
- Vertical linearity correction
- Vertical S correction
- Vertical EHT correction
- E/W parabola correction
- E/W corner correction
- E/W trapezium correction

BLOCK DIAGRAM

PIN FUNCTION

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
1	VSM OUT	VSM means Verocity Scanning Modulation.		
2	GND I	The terminal for GND of Video / Y / TEXT circuits.	—	
3 4 5	R _{IN} G _{IN} B _{IN}	The terminals for Analog RGB signal input. Input signals clamped by coupling capacitors. (*)Even when not in use, connect to GND with a coupling capacitor.		100 IRE = 0.5 V _{p-p} 3.7 V
6	Y _S / Y _M IN	The terminal for switching of Analog RGB Mode and Half tone.		RGB 2.1 V Half Tone 0.7 V TV GND
7 8 9	OSD R IN OSD G IN OSD B IN	The terminals for Analog OSD RGB signal input. Input signals clamped by coupling capacitors. (*)Even when not in use, connect to GND with a coupling capacitor.		100 IRE = 1.25 V _{p-p} 5.5 V

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
10	OSD Y _S IN	The terminal for switching of internal RGB signals and Analog OSD RGB signals (Pin 7, 8, 9).		Analog RGB 2.8 V Main GND
11	ABL IN	The terminal for the external unicolor and brightness control. ABL Gain and ABL start point can be set by using BUS.		OPEN 6.0 V
12	VK OUT	The terminal outputs signal in order to input in H-correction (Pin 42). The signal corresponds to RGB signal.		
13 14 15	R OUT G OUT B OUT	The terminals for RGB signal output.		
16	V _{CC} (9 V)	The terminal for V _{CC} Supply 9 V. The terminals is connected to 9 V (typ.).	—	
17 18 19	R Filter G Filter B Filter	Control the RGB output cutoff voltage, holding the standard pulse period comparator output to one vertical period. For this control, use the bus function RGB cutoff. The filters must be low leakage current filters.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
20	NOISE FILTER	Connect to GND with a $0.47\text{-}\mu\text{F}$ coupling capacitor.		
21	V Centering	The terminal for the DAC output that controlled by BUS (V-center).		
22	EW FB	The terminal for E/W feedback.		
23	EW OUT	The terminal for output of E/W drive signal.		
24	V OUT	The terminal for output of Vertical drive signal.		
25	V NFB	The terminal for input of Vertical negative feedback. If input voltage is less than 2 V, V-Guard function works and blanks RGB signal output.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
26	V AGC Filter	The terminal to be connected a capacitor for Automatic gain control of Vertical RAMP signal.		
27	V RAMP	The terminal to be connected a capacitor to generate Vertical RAMP signal.		
28	EHT V	The terminal for the Vertical EHT input.		
29	SCL	The terminal for input of I²C BUS clock.		
30	SDA	The terminal for input/output of I²C BUS data.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
31	GND II	The terminal for the GND of DEF/ I ² C / EW.	—	
32	HD OUT	The terminal for the HD pulse. The suspension period of the Black peak stretching is extended by inputting the external pulse.		
33	VD OUT	The terminal for the VD pulse.		
34	FBB IN	The terminal for the flyback pulse to control H-BLK and H-AFC.		
35	H OUT	The terminal for the Horizontal output.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
36	SYNC OUT	The terminal for output of the synchronizing signal that was separated in the synchronous separation circuit. This terminal is of the open collector system. Connect the pull-up resistor.		
37	DEF V _{CC}	The terminal for V _{CC} supply 9 V of DEF.	(Caution) Be sure to design the power supply so that when the power is Off, DEF V _{CC} is below 1.9 V.	
38	Y/SYNC IN	The terminal for input of the synchronous separation circuit. Input via clamp capacitor.		
39	V SEP Filter	The terminal to be connected a capacitor for the Vertical synchronous separation circuit.		
40	AFC I Filter	Connect the filter for horizontal AFC I detection. The frequency of the horizontal output varies depending on the voltage at this pin.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
41	32 fh VCO	Connect the ceramic oscillator for horizontal oscillation. The oscillator to be used is CSB503F30, made by Murata electronics.		
42	H Correction	The terminal to correct distortion of picture in the case of high-tension fluctuation. Input the AC component of high tension fluctuation. This terminal can be inputted VK output (Pin 12).		
43	DL OUT	The terminal outputs delayed Y signal. Input this signal to Y IN (Pin 54) via a capacitor.		
44	GND III	The terminal for GND of DEF linear / Chroma circuits.	—	
45	CHROMA IN	The terminal for the chroma input.		DC : 1.77 V AC : Burst 286 mV _{p-p}

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
46	APC	The terminal to be connected APC filter. The oscillation frequency of VCXO varies depending on the voltage at this pin.		
47	B-Y OUT	The terminal outputs the B-Y signal.		DC : 2.2 V AC : 300mV _{p-p} (Rainbow color bar)
48	R-Y OUT	The terminal outputs the R-Y signal.		DC : 2.2 V AC : 300 mV _{p-p} (Rainbow color bar)
49	X'tal	The terminal to be connected with a 3.579545 MHz X'tal oscillator. The oscillated frequency, f_0 , is controlled by series capacitors, and frequency adjustment range can be expanded by putting capacitors in parallel.		
50	CW OUT	The terminal for CW output generated in VCXO.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
51	V _{CC} (5 V)	The terminal for V _{CC} supply 5 V.	—	
52 53	R-Y IN B-Y IN	The terminals for the R-Y/B-Y signal input. Input signals clamped by coupling capacitors. (*)Even when not in use, connect to GND with a coupling capacitor.		
54	Y IN	The terminal for the Y signal input. Input the Y signals clamped by coupling capacitors.		
55	BLACK PEAK DET	The terminal to be connected the filter controlling the black stretching gain of the black stretching circuit. The black stretching gain varies depending on the voltage at this pin.		
56	DC RESTORATION CORR.	The terminal to be connected capacitor for DC restoration correction control. Open this pin if not use the DC restoration correction.

I²C BUS COMMUNICATIONS, RECEIVE METHOD

Start and stop condition

Bit transfer

Acknowledgement

Data receive format

When data are received, the master transmitter changes to a receiver immediately after the first acknowledgement and the slave receiver changes to a transmitter.

The master always creates the stop condition.

Details are provided in the Philips I²C specifications.

Option data transmit format

In the above method, the subaddresses are automatically incremented from the specified subaddress and data are set.

Purchase of TOSHIBA I²C components conveys license under the Philips I²C patent Rights to use these components in an I²C system, provided that the system conforms to the I²C standard specification as defined by Philips.

MAXIMUM RATINGS (Ta = 25°C)

CHARACTERISTICS	SYMBOL	RATING	UNIT
Power Supply Voltage (5 V / 9 V)	V _{CCmax}	7 / 12	V
Input Signal Voltage (5 V / 9 V)	einmax	5 / 9	V _{p-p}
Power Dissipation (Note)	P _D	1920	mW

						<p>① Set the bus control data to the preset value. ② Input a signal like that shown in the diagram below to TP54, turn the Y mute off (0), and adjust the amplitude of #54 to 0.7 V_{p-p}. ③ Set the unicolor to the maximum (111111), increase the picture sharpness from the minimum to a level where the R OUT waveform is not distorted. ④ Measure the phase differences TVM24, TVMF, and TVM2T between TP1 (VSMOUT) and TP13 (R OUT) when the signal is an FVSM sine wave, a 2T pulse, and a 2.4-MHz signal, as shown in the diagram below. (To make a waveform at TP1, reverse the waveform at TP13 using an oscilloscope.)</p>
P24	VSM Phase	A	B	OPEN		

(Note 1) : When testing, see the picture sharpness test circuit diagram. First turn ACB mode off (bus control).
 (Note 2) : Ensure the composite signal is always input to pin 38 (SYNC IN).

NOTE	ITEM	SW MODE	MEASUREMENT METHOD
C1	ACC Characteristics	B ON SW45 SW46	<p>(#16 V_{CC} = 9 V, #37 V_{CC} = 9 V, #51 V_{CC} = 5 V, Ta = 25 ± 3°C)</p> <p>① Input a rainbow signal (signal C-1) to the chroma input pin (TP45). Burst : chroma = 1 : 1</p> <p>② When the chroma input amplitude levels are set to 10, 30, 300, and 600 mV_{p-p}, measure the output amplitudes va10, va30, va300, and va600 of the R-Y output pin (TP48).</p> <p>③ Calculate A = va30 / va600.</p>
C2	Color Difference Output Level	B ON	<p>① Input a rainbow signal (signal C-1) to the chroma input pin (TP45). Burst : chroma = 300 mV_{p-p} : 300 mV_{p-p}</p> <p>② Change the burst phase so that bar 2 of the B-Y output pin (TP47) output waveform is the bottom peak and bar 7 is the top peak.</p> <p>③ Measure the amplitude (v_B) of the B-Y output pin (TP47).</p> <p>④ Set the burst phase to 180°.</p> <p>⑤ Measure the amplitude (v_R) of the R-Y output pin (TP48).</p>
C3	Color Difference Output Relative Amplitude	B ON	<p>① Calculate the relative amplitude v_{RB} from the following formula using the values obtained in steps ③ and ⑤ of C02 above.</p> $v_{RB} = v_R / v_B$ <p>① Input a rainbow signal (C-1) to the chroma input pin (TP45). Burst : chroma = 200 mV_{p-p} : 200 mV_{p-p}</p> <p>② Calculate the demodulation angles θ_{Bcnt} and θ_{Rcnt} of the B-Y output pin (TP47) and the R-Y output pin (TP48) using the formulas and diagram below.</p>
C4	Color Difference Output Demodulation Angle	B ON	<p>Peak</p> <p>$\theta_{Bcnt} = 0^\circ - \tan^{-1} \left[\frac{1}{\frac{2A}{B} + \sqrt{3}} \right] - 15^\circ$ (Bar 6 is the peak at B-Y)</p> <p>$\theta_{Rcnt} = 90^\circ - \tan^{-1} \left[\frac{1}{\frac{2A}{B} + \sqrt{3}} \right] - 15^\circ$ (Bar 3 is the peak at R-Y)</p> <p>Demodulation waveform</p>
C5	Color Difference Output Relative Phase	B ON	<p>① Calculate the relative phase θ_{RB} from the following formula using the values obtained in C04 above.</p> $\theta_{RB} = \theta_{Rcnt} - \theta_{Bcnt}$

(Note 1) : Where the bus data are not specified, set the preset values.
 (Note 2) : Ensure the sync signal is always input to TP38 (SYNC IN).

NOTE	ITEM	SW MODE SW45 SW46	MEASUREMENT METHOD
C6	Color Difference Output Tint Adjustment Characteristics	B ON	<p>(#16 V_{CC} = 9 V, #37 V_{CC} = 9 V, #51 V_{CC} = 5 V, Ta = 25 ± 3°C)</p> <p>① Input a rainbow signal (signal C-1) to the chroma input pin (TP45).</p> <p> Burst : chroma = 300 mV_{p-p} : 300 mV_{p-p}</p> <p>② Measure the demodulation angles θ_{B'} and θ_{R'} in the outputs with the tint set to the maximum (subaddress (03H), data (FE)). Calculate θ_{Bmax} and θ_{Rmax} by the following formulas.</p> $\theta_{Bmax} = \theta_{B'} - \theta_{Bcnt}$ $\theta_{Rmax} = \theta_{R'} - \theta_{Rcnt}$ <p>③ Measure the demodulation angles θ_{B''} and θ_{R''} in the outputs with the tint set to the minimum (subaddress (03H), data (00)). Calculate θ_{Bmin} and θ_{Rmin} by the following formulas.</p> $\theta_{Bmin} = \theta_{B''} - \theta_{Bcnt}$ $\theta_{Rmin} = \theta_{R''} - \theta_{Rcnt}$
C7	Supply Voltage Dependence of Color Difference Output	B ON	<p>① Input a rainbow signal (signal C-1) to the chroma input pin (TP45).</p> <p> Burst : chroma = 300 mV_{p-p} : 300 mV_{p-p}</p> <p>② As in C02, measure the amplitudes ΔV_{Bp} and ΔV_{Rp} of the B-Y output pin (TP47) and R-Y output pin (TP48) when the 5-V V_{CC} is set to 5 V + 0.3 V. Calculate the amplitude ratios B_{Vp} and R_{Vp} when the 5-V V_{CC} is set to 5 V.</p> $B_{Vp} = \frac{\Delta V_{Bp} - v_B}{v_B} \times 100$ $R_{Vp} = \frac{\Delta V_{Rp} - v_R}{v_R} \times 100$ <p>③ Using the same tests as above, calculate B_{Vn} and R_{Vn} when the 5-V V_{CC} is set to 5 V - 0.3 V</p> $B_{Vn} = \frac{\Delta V_{Bn} - v_B}{v_B} \times 100$ $R_{Vn} = \frac{\Delta V_{Rn} - v_R}{v_R} \times 100$
C8	Identification Sensitivity	B ON	<p>① Input a rainbow signal (signal C-1) to the chroma input pin (TP45).</p> <p> Burst : chroma = 1 : 1</p> <p>② Gradually reduce the input signal amplitude from 100 mV_{p-p}. When the B-Y output pin (TP47) signal disappears (when the current is DC), measure the input signal amplitude v_{CB}.</p> <p>③ Gradually increase the input signal amplitude from 0 mV_{p-p}. When a demodulation signal appears on the B-Y output pin (TP47), measure the input signal amplitude v_{BC}.</p>
C9	Bus Read Identification	B	<p>① Perform the same tests as above while observing the bus read : When the input signal amplitude is v_{CB}, check that the first bit is set to 0 (bCB). When the input signal amplitude is v_{BC}, check that the first bit is set to 1 (bBC).</p>

(Note 1) : Where the bus data are not specified, set the preset values.

(Note 2) : Ensure the sync signal is always input to TP38 (SYNC IN).

NOTE	ITEM	SW MODE		MEASUREMENT METHOD
		SW45	SW46	
C10	Color Difference Output Voltage Difference in 1H Period	B	ON	<p>① Input no more than 300-mVp-p as a burst signal to chroma input pin (TP45). ② Measure the DC voltage difference (v_{BH}) between the H blanking period and picture period of the B-Y output pin (TP47). ③ Measure the DC voltage difference (v_{RH}) between the H blanking period and picture period of the R-Y output pin (TP48).</p> 
C11	Color Difference Output Voltage Difference Every 1H Period	B	ON	<p>① Input no more than 300-mVp-p as a burst signal to chroma input pin (TP45). ② Measure the DC voltage difference (v_{BG}) between the H picture period and $H + 1$ picture period of the B-Y output pin (TP47). ③ Measure the DC voltage difference (v_{RG}) between the H picture period and $H + 1$ picture period of the R-Y output pin (TP48).</p> 
C12	Color Difference Output DC Voltage	B	ON	<p>① Input no more than 300-mVp-p as a burst signal to chroma input pin (TP45). ② Measure the picture period DC voltage V_B of the B-Y output pin (TP47). ③ Measure the picture period DC voltage V_R of the R-Y output pin (TP48).</p>
C13	Difference between DC Voltage Axes of Color Difference Output	B	ON	<p>① Use the following formula to calculate the difference (V_{RB}) between the voltage axes from the following formula using the values obtained in C12 above. $V_{RB} = V_R - V_B$</p>
C14	X'tal Free-Run Frequency	A	ON	<p>① No signal input to the chroma input pin (TP45) (set SW45 to A). ② Observe the CW output pin (TP50) and measure the output frequency X_f.</p>

(Note 1) : Where the bus data are not specified, set the preset values.
 (Note 2) : Ensure the sync signal is always input to TP38 (SYNC IN).

NOTE	ITEM	SW MODE SW45 SW46	(#16 V _{CC} = 9 V, #37 V _{CC} = 9 V, #51 V _{CC} = 5 V, Ta = 25 ± 3°C)	MEASUREMENT METHOD
C15	APC Frequency Control Sensitivity	A OFF	<p>① No signal input to the chroma input pin (TP45) (set SW45 to A). ② Set SW46 to open and connect an external power supply to the APC filter pin (#46).</p> <p>③ Change the voltage of external power supply to a value regarded as V_{c3}, where the output frequency of the CW output pin (TP50) is 3.579545 MHz (X_f). ④ Measure the CW output frequencies X_f (+100) and X_f (-100) for V_{c3} + ΔV_{c3} (±100 mV). Calculate the free-run sensitivity β_f from the following formula.</p>	$\beta_f = \frac{X_f (+100) - X_f (-100)}{200}$ 
C16	APC Pull-In / Hold Range	B ON	<p>① Input a 3.579545-MHz sine wave (300 mV_{p-p}) to the chroma input pin (TP45). ② Vary the input sine wave frequency in ±10-Hz steps from 3.579545 MHz. When the B-Y output pin (TP47) picture period amplitude changes, measure the difference between 3.579545 MHz and the varied sine wave frequencies : on the plus side, f_{h+}, and on the minus side, f_{h-} (hold). ③ Increase and decrease the above measured values by 1 kHz : (f_{h+}) + 1 kHz and (f_{h-}) - 1 kHz. Adjust to approximately 3.579545 MHz in ±10-Hz steps. When the B-Y output pin (TP47) picture period amplitude changes, measure the difference from 3.579545 MHz : on the plus side, f_{p+}, and on the minus side, f_{p-} (pull-in).</p>	
C17	Residual Carrier Level	B ON	<p>① Input a rainbow signal (signal C-1) to the chroma input pin (TP45). Burst : chroma = 300 mV_{p-p} : 300 mV_{p-p} ② Measure the color subcarrier leak levels v_{BNO} and v_{RNO} of the B-Y output pin (TP47) and the R-Y output pin (TP48).</p>	<p>① Input a rainbow signal (signal C-1) to the chroma input pin (TP45). Burst : chroma = 300 mV_{p-p} : 300 mV_{p-p} ② Measure the higher harmonic levels v_{BHN} and v_{RHN} of the B-Y output pin (TP47) and the R-Y output pin (TP48).</p>
C18	Residual Higher Harmonic Level	B ON		

(Note 1) : Where the bus data are not specified, set the preset values.
 (Note 2) : Ensure the sync signal is always input to TP38 (SYNC IN).

A1	Color Difference Input Clamp Voltage	C	A	A	A
A2	Color Difference Input/Output Delay Time	C	A	B	B
A3	Unicolor Adjustment Characteristics	C	A	B	B

(1) Connect the color difference input pin to AC-GND. (Set SW52A and SW53A to A.)
 (2) Measure the voltage VRY of the R-Y input pin (#52) and the voltage VBY of the B-Y input pin (#53).

(1) Set to external color difference input mode (subaddress (05H), data (81)).
 (2) Now set as follows :
 Unicolor : maximum (subaddress (00H), data (3F))
 Brightness : maximum (subaddress (01H), data (7F))
 Color : center (subaddress (02H), data (40)).
 (3) Set SW52A and SW53A to B. Input signal C-2 to the R-Y input pin (TP52) and the B-Y input pin (TP53).
 $f_0 = 100 \text{ kHz}$, picture period amplitude = 0.2 V_{p-p}

(4) Measure the signal delay time (DLRY) from the R-Y input pin (TP52) to the R output (TP13).
 (5) Measure the signal delay time (DLBY) from the B-Y input pin (TP53) to the B output (TP15).

(1) Set to external color difference input mode (subaddress (05H), data (81)).
 (2) Now set as follows :
 Brightness : maximum (subaddress (01H), data (7F))
 Color : center (subaddress (02H), data (40))
 Relative phase amplitude : standard (subaddress (12H), data (00)).
 (3) Set SW52A and SW53A to B. Input signal C-2 to the R-Y input pin (TP52) and the B-Y input pin (TP53).
 $f_0 = 100 \text{ kHz}$, picture period amplitude = 0.2 V_{p-p}

(4) Set unicolor to the maximum (subaddress (00H), data (3F)). Measure the RUmax, the amplitude of the R output (TP13), and BUmax, the amplitude of B output (TP15).
 (5) Set unicolor to the minimum (subaddress (00H), data (00)). Measure the Rumin, the amplitude of the R output (TP13), and BUmin, the amplitude of B output (TP15).
 (6) Calculate the unicolor adjustment characteristics uR and uB by the following formulas.

$$uR = 20 \log \frac{RU_{min}}{RU_{max}}$$

$$uB = 20 \log \frac{BU_{min}}{BU_{max}}$$

(Note 1) : Where the bus data are not specified, set the preset value.
 (Note 2) : Ensure the sync signal is always input to TP38 (SYNC IN).

MEASUREMENT METHOD

(1) Change subaddress (05) H to (81) H.
(2) Set unicolor = max ; bright = max ; color = center.
(3) Input signal 1 ($f_0 = 100 \text{ kHz}$, 100 mV_{p-p}) to pin 53.
(4) To pin 52, input a signal with the same amplitude but 90°C phase advanced compared to the signal input to pin 53.
(5) When subaddress (14) H is changed to (C0) H → (80) H, measure the amount of change in the output phase of pin 13. (ANG RMIN)
(6) Under the same conditions as (5) above, measure the amount of change in the output phase of pin 15. (ANG BMIN)
(7) When subaddress (14) H is changed to (C0) H → (FF), measure the amount of change in the output phase of pin 13. (ANG RMAX)
(8) Under the same conditions as (7) above, measure the amount of change in the output phase of pin 15. (ANG BMAX)

(1) Change subaddress (05) H to (81) H.
(2) Set unicolor = max ; bright = max ; color = center.
Relative amplitude, phase switching: Change subaddress (12) H to (00).
(3) Input signal 1 ($f_0 = 100 \text{ kHz}$, 100 mV_{p-p}) to pin 53.
(4) To pin 52, input a signal with the same amplitude but 90°C phase advanced compared to the signal input to pin 53.
(5) Changing subaddress (14) H from (C0) H, read the transmission data at subaddress (14) H when the output phase of the pin 15 signal is the same as the input phase of the pin 53 signal. (BUS B0)
