

microSPARC™-II

DATA SHEET

SPARC v8 32-Bit Microprocessor With DRAM Interface

DESCRIPTION

The microSPARC-II 32-bit microprocessor is a highly integrated, high-performance microprocessor. Implementing the SPARC Architecture v8 specification, it is ideally suited for low-cost uniprocessor applications.

It is built with leading edge CMOS technology, featuring 0.5 micron geometries, 3-layer metal silicon process, with the core operating at low voltage for optimized power consumption.

The microSPARC-II includes on chip: Integer Unit (IU), Floating Point Unit (FPU), large separate Instruction and Data Caches, v8 Reference MMU, Programmable DRAM controller, SBus Controller, Graphics Interface support, Internal and Boundary Scan through JTAG Interface, Power Management and Clock Generation capabilities.

Taking advantage of optimized Compiler technology, impressive performance is achieved executing industry standard benchmarks. At 110 MHz, the estimated performance is 78 SPECint92 and 65 SPECfp92.

Features

- SPARC High Performance RISC architecture
- Operating Frequency up to 110 MHz
- 8 window, 136-word register file
- 16 Kbyte Instruction cache, 8 Kbyte Data cache
- On-chip Memory Management Unit
- Optimized Integrated Floating-Point Unit
- Interface to S-Bus at 1/3, 1/4, 1/5 system clock
- Integrated DRAM controller
- On-chip Local Bus Controller (graphics)
- IEEE1149.1 (JTAG) boundary scan test bus
- 321-pin Ceramic PGA package

Benefits

- Compatible with 9400 SPARC applications and development tools
- 135.5 KDbystone @ 110 MHz
- Fast interrupt response, procedure calls and program execution
- Decouples processor operation from slow external memory
- Support for sophisticated operating systems with memory protection and virtual addressing
- 21.7 MFlops peak performance
- Connection to industry standard expansion bus
- Simple, low part count system design
- High-performance graphics with minimum part count
- Ease of manufacturing test
- Small footprint package with high thermal efficiency

Figure 1. microSPARC-II Block Diagram

Figure 2. Typical microSPARC-II System Block Diagram

TECHNICAL OVERVIEW

Integer Unit (IU)

The STP1012 Integer Unit executes SPARC integer instructions defined in the SPARC Architecture Manual (Version 8). The IU contains 136 registers (8-window registers and 8-global registers) and operates on prefetched instructions using a five-stage pipeline.

The throughput is improved by using Branch folding and single cycle Load/Store instructions.

Floating Point Unit (FPU)

The FPU (based on Meiko design) fully executes all single and double precision FP instructions as defined in the SPARC Architecture Manual (Version 8). Quad-precision instructions trap and are implemented in software. The FPU contains 32x32 *f* registers, a general purpose execution unit and an FP multiplier allowing in most cases the parallel execution of an FPMUL and another FP instruction. A 3-instruction deep queue of FP instructions is provided to increase the efficiency of concurrent FP and integer execution.

Memory Management Unit (MMU)

The microSPARC-II MMU translates 32-bit virtual addresses of each running process to 31-bit physical addresses in memory. The 3 high-order bits of physical address are maintained to support memory mapping into 8 different address spaces.

It also serves as an I/O MMU and controls the arbitration between I/O, Data Cache, Instruction Cache, and TLB references to memory.

The MMU contains a 64-entry fully associative TLB and is compatible with the SPARC v8 Reference MMU. It supports 256 contexts and protects memory so that a process can be prohibited from reading or writing to the address space of another process.

Instruction Cache

The instruction Cache is a 16-KByte, direct mapped, virtually indexed, virtually tagged cache. The Instruction Cache data is organized as 512 lines of 32 bytes plus 32 tag bits. Cache refill is done two 32-bit words at a time and cache streaming and bypass are supported.

Data Cache

The Data Cache is an 8-KByte, direct mapped, virtually indexed, virtually tagged, write through cache with no write allocate. The data store is organized as 512 lines of 16 bytes plus 32 tag bits.

Single word Integer and double word FP read and write cache hits take only 1 clock cycle.

There is a 4-deep Store Buffer to hold data being stored from the IU or FPU to memory or other physical devices. The Store Buffers are 64-bit registers.

Cache refill is done 2x32-bit words at a time and cache streaming and bypass are supported.

Memory Interface

The STP1012 provides a complete DRAM controller which generates all the signals necessary to support up to 256 MBytes of system memory.

The DRAM bus is 64 bits wide with two parity bits, one covering each 32 bits of data.

The system DRAM is organized as eight banks, each of which may be 2 MBytes, 8 MBytes, or 32 MBytes depending upon the size of DRAM used.

The STP1012 RAM Refresh Control logic provides complete DRAM Refresh Control. This Refresh Controller performs *CAS*-before-*RAS* refresh. Refresh interval is programmable and self-refreshed DRAMs are also supported.

SBus Interface

The SBus Interface performs all functions necessary to connect the STP1012 to the SBus, including dynamic bus sizing, cycle re-run control, burst cycle re-ordering, arbitration, and general SBus control.

It controls SBus devices sharing the bus, supporting:

- Programmed Input/Output (PIO) transactions between the CPU and SBus devices.
- Direct Virtual Memory Access (DVMA) transactions between SBus masters and local resources. (referred to as Local DVMA)
- Direct Virtual Memory Access (DVMA) transactions between SBus masters and other SBus slave devices. (referred to as SBus DVMA)

The SBus interface works with the MMU to arbitrate the system and memory resources and for I/O address translations.

JTAG Test Bus Interface

The STP1012 has a five-wire Test Access Port (TAP) interface to support internal scan, boundary scan and clock control. This interface is compatible with IEEE 1149.1 specification, "IEEE Standard Test Access Port and Boundary Scan Architecture". This allows efficient access to any single chip in the daisy-chain without board-level multiplexing.

TAP Controller

The TAP controller is a synchronous Finite State Machine (FSM) which controls the sequence of operations of the JTAG test circuitry, in response to changes at the JTAG bus. The TAP controller is asynchronous with respect to the system clock(s), and can therefore be used to control the clock control logic.

The TAP FSM implements the state (16 states) diagram as detailed in the 1149.1 protocol.

SIGNAL DESCRIPTIONS

Signal	Type	Description
MEMDATA[63:0]	I/O	64-bit bidirectional memory data bus for accessing main memory.
MEMPAR[1:0]	I/O	Bidirectional memory data parity pins. Parity is provided on a word basis (for DRAM only).
MEMADDR[11:0]	Out	DRAM address output pins. These memory address pins require external buffering to provide the necessary drive for the DRAMs.
RAS_L[7:0]	Out	DRAM Row Address Strobe. Eight separate RAS signals, buffered externally to provide sufficient drive to connect directly to the DRAMs. 8 DRAM banks are supported.
CAS_L[3:0]	Out	DRAM Column Address Strobes. Four separate CAS signals are provided for word access. They should be buffered externally to provide sufficient drive to connect directly to the DRAMs. Two separate banks are supported by the 4 CAS lines.
MWE_L	Out	DRAM Write Enable output pin. MWE should be buffered externally to provide sufficient drive to connect directly to the DRAMs.
SBADDR[27:0]	Out	SBus Address output pins, to provide the Physical Address to SBus slave devices.
SBDATA[31:0]	I/O	Bidirectional SBus data pins. The 32-bit SBus data pins provide SBus support for the CPU, and support DBMA cycle access via the CPU SBus controller.
SLVSEL_L[4:0]	Out	Output Slave Select pins. A separate slave select is driven to each SBus slot and the I/O chip. This is used in conjunction with the physical address for accessing each slot/device.
SB_SIZE[2:0]	I/O	Bidirectional SBus transfer Size description pins. These three pins describe (encoded) the size of the data transfer of the current SBus operation (See SBus controller section).
SB_READ	I/O	Bidirectional SBus Read/Write pin. This pin indicates whether the current transfer is a read or a write operation.
SBCLK[2:0]	Out	SBus clock (16.6 MHz to 25 MHz depends on the input frequency and the DIV_CTL_setting) output pin.
SB_AS_L	Out	SBus Address Strobe Output pin.
SB_ACK_L[2:0]	I/O	Transfer Acknowledgment bidirectional pins. The ACK[2:0] pins return the status (encoded) of the current SBus transfer, from the slave.
SB_LERR_L	In	SBus Late data Error input pin. This pin is driven by the current SBUs slave, and aborts the current SBus transfer.
SB_BR_L[5:0]	In	Bus Request input pins (1/Bus Master).
SB_BG_L[5:0]	Out	Bus Grant output pins 1/Bus Master).
IRL[3:0]	In	Interrupt Request Lines Input pins. These 4 pins represent the encoded highest priority, pending interrupt. These pins are driven by the I/O chip, directly to the CPU.
CP_STAT_L[1:0]	Out	Active low CP Status output pins. Used to indicate CP interrupt/trap status as follows: 11 - Normal 10 - Level 15 interrupt 01 - Trap occurred, when trap disabled 00 - Reserved
JTAG_CK	In	Test (JTAG) input clock for boundary scan registers.
JTAG_MS	In	Test Mode Select input pin.
JTAG_TDI	In	Test Data Input pin (JTAG standard).
JTAG_TRST	In	JTAG Reset pin (JTAG standard).

SIGNAL DESCRIPTIONS (CONTINUED)

Signal	Type	Description
JTAG_TDO	Out	Test Data Output pin (JTAG standard).
EXT_CLK1 EXT_CLK2	In	CPU input clock pins. EXT_CLK1 is used as the clock to sync up with the phase lock loop. EXT_CLK2 is used to <i>EXclusiveOr</i> with EXT_CLK1 to produce the clock in bypass PLL mode.
INPUT_RESET_L	In	Power-up reset input pin.
SP_SEL[1:0]	In	These two input pins set the memory controller to operate with various DRAM speeds at different processor clock frequencies. Typically, for 60ns DRAMs: 00 = 70 MHz 01 = 85 MHz. (See Table 1 "Memory Interface Timing") 10 = 110 MHz (See Table 1 "Memory Interface Timing")
DIV_CNTL[1:0]	In	These two input pins set the division ratio for the SBus clock from the internal system clock as follows: 00 = Illegal condition 01 = ÷ 3 10 = ÷ 4 11 = ÷ 5
Reserved 0	In	Pull to V _{DD2} .
Reserved 1	Out	Leave open.
STANDBY	In	Input pin to put the CPU in Standby mode. Apply a "0" logic level in normal operation.
REF_CLOCK	Out	Clock output at 2x frequency of EXT_CLK1.
PLL_BYP_L	In	Input pin to select output of the Phase Lock Loop (when 1) or the clock inputs directly (when 0).
SB_CR_L	Out	SBus CPU request output. For Debug only.
SB_CG_L	Out	SBus CPU grant output. For Debug only.
Reserved 2	In	Leave open.
Reserved 3	Out	Leave open.
GCLK	Out	Graphic clock output for the local bus. This is generated by dividing the SS_CLOCK by 3.
AEN	Out	Address enable output. (local bus)
S_REPLY	Out	Output pins defining the graphic operations.
P_REPLY[1:0]	In	Input pins defining when to take data from the data bus or when the buffer is emptied from the frame buffer.
AB[14:12]	Out	Address bits for local bus.
VDD1, VSS1	In	Core power/ground.
VDD2, VSS2	In	Power/ground for non-memory I/O.
VDD3, VSS3	In	Power/ground for memory interface I/O.
VDD4, VSS4	In	First power/ground for PLL.
VDD5, VSS5	In	Second power/ground for PLL.

TIMING CONSIDERATIONS

TABLE 1: Memory Interface Timing

Description	Number of cycles			
	sp_sel = 00	sp_sel = 01	sp_sel = 10	sp_sel = 11
RAS precharge	3.5	3.5	4.5	5.5
CAS precharge	1	1	2	2
RAS active (read)	6.5	7.5	8.5	10.5
RAS active (write)	5.5	5.5	6.5	8.5
CAS active (read)	3	4	4	5
CAS active (write)	2	2	2	3
Data, WE, parity sent before CAS	1	2	2	2
Data, WE, parity hold after CAS active	2	2	2	3
Column address sent before CAS	1	1	2	2
CAS-before-RAS (refresh)	1.5	1.5	2.5	3.5
RAS active (refresh)	6.5	6.5	6.5	8.5

		V_{DD1} , V_{DD2} , $V_{DD3} = \text{max}$, $f = 110 \text{ MHz}$	—	—	9	W

1. SB_CR, SB_CG, ISSURE_REQ, REF_CLOCK, JTAG_TDO, SLVSEL, SB_BG, CP_STAT, MEMADDR, RAS, CAS, MWE outputs only.
2. For each line of SBCLK output only.
3. MEMPAR, MEMDATA, SBDATA, SB_ACK, SB_SIZE, SB_READ, SBADDR and SB_AS outputs only.
4. JTAG_MS, JTAG_TRST, JTAG_TDI, JTAG_CK, INPUT_RESET_L, PLL_BYP_L (Internal Pull-up).

Capacitance

Symbol	Parameter	Max	Units
C_{IN}	Input capacitance	15	pF
C_{OUT}	Output capacitance	10	pF
C_{BI}	Bidirectional capacitance	15	pF

Parameter Definitions

- t_{SI} : Required setup time of a chip input referenced to a given (clock) edge.
- t_{HI} : Required hold time of a chip input referenced to a given (clock) edge.
- t_{PO} : Guaranteed propagation time of an output referenced to a given (clock) edge.
- t_{HO} : Guaranteed hold time of an output referenced to a given (clock) edge.
- t_{SO} : Guaranteed setup time of an output referenced to a next given (clock) edge.
- t_{HC} : Required clock high time.
- t_{LC} : Required clock low time.
- t_{RC} : Required clock rise time.
- t_{FC} : Required clock fall time.

ERRATA

This errata applies to the following products:

- STP1012PGA-70A microSPARC-II CPU
- STP1012PGA-85 microSPARC-II CPU
- STP1012PGA-110 microSPARC-II CPU

Errata Categories:

System Design

These errata are deviations from the product specification that a system design engineer needs to be aware of. These would include bus protocol, mechanical and thermal errata.

Performance

These errata result only in a loss in performance. These errata do not cause functional errors.

Operating System

These errata only occur with privileged-mode or supervisor-mode instructions. Workarounds should be implemented in the operating system or boot PROM. The target audience is the operating system or system firmware engineer.

Application Software

These errata can occur with nonprivileged-mode or user-mode instructions. The target audience is anyone writing software for a platform using this part, including the end-user, independent software vendors, and operating system engineers.

Each erratum will have the following rating scale at the top of each description:

System Design	Performance	Operating System	Application
---------------	-------------	------------------	-------------

Erratum: Incorrect MASK ID:

System Design	Performance	Operating System	Application
---------------	-------------	------------------	-------------

Description: (Ref. #309954)

Reading the Mask ID field in the Virtual Address Mask Register returns a value of 0x25 instead of the correct Mask ID of 0x26. If the system firmware uses the value of MASK ID field to determine the revision of microSPARC II, then it will not be able to distinguish between this revision and the older revision which also had a MASK ID of 0x25.

Workaround:

No work around is needed as this will not cause any observable system failure. The letter "H" on the part number allows the user to distinguish this revision from the older revisions of STP1012 part. The marking for this revision is:

```
microSPARC-II
STP1012 www  (www are package type information)
MB86904
xxxx xxxH   (xxxx xxx are other date code information)
```

This erratum will be fixed in parts with the letter "K" in the date code marking:

```
xxxx xxxK
```

Erratum: JMPL in the Delay Slot of Unconditional Annulling Branch:

System Design	Performance	Operating System	Application
---------------	-------------	------------------	-------------

Description: (Ref. #321015)

Normally, the delay slot of an unconditional annulling branch should be ignored and not executed. Due to this error, if the delay slot of an unconditional annulling branch is a JMPL instruction the sequence of instructions fetched by the Integer Unit after the JMPL instruction may be incorrect and therefore may produce unpredictable results. This sequence has not been seen to occur in code generated by SPARC compilers. Code written in assembly language should always insert a NOP in the delay slot of all unconditional annulling branches.

Workaround:

The program should always insert a NOP in the delay slot of an unconditional annulling branch. For example:

```
ba, a    target-addr
nop
...
```

There are no plans to fix this erratum.

ORDERING INFORMATION

Part Number	Speed	Description
STP1012PGA-70A	70 MHz	Standard Supply Voltages
STP1012PGA-85	85 MHz	Special Supply Voltages
STP1012PGA-110	110 MHz	Special Supply Voltages

Document Part Number: STP1012
