## ISD2560/75/90/120

SINGLE-CHIP, MULTIPLE-MESSAGES, VOICE RECORD/PLAYBACK DEVICE 60-, 75-, 90-, AND 120-SECOND DURATION

## 1. GENERAL DESCRIPTION

Winbond's ISD2500 ChipCorder ${ }^{\circledR}$ Series provide high-quality, single-chip, Record/Playback solutions for $60-$ to 120 -second messaging applications. The CMOS devices include an on-chip oscillator, microphone preamplifier, automatic gain control, antialiasing filter, smoothing filter, speaker amplifier, and high density multi-level storage array. In addition, the ISD2500 is microcontroller compatible, allowing complex messaging and addressing to be achieved. Recordings are stored into on-chip nonvolatile memory cells, providing zero-power message storage. This unique, single-chip solution is made possible through Winbond's patented multilevel storage technology. Voice and audio signals are stored directly into memory in their natural form, providing high-quality, solid-state voice reproduction.

## 2. FEATURES

- Easy-to-use single-chip, voice record/playback solution
- High-quality, natural voice/audio reproduction
- Single-chip with duration of $60,75,90$, or 120 seconds.
- Manual switch or microcontroller compatible
- Playback can be edge- or level-activated
- Directly cascadable for longer durations
- Automatic power-down (push-button mode)
- Standby current $1 \mu \mathrm{~A}$ (typical)
- Zero-power message storage
- Eliminates battery backup circuits
- Fully addressable to handle multiple messages
- 100-year message retention (typical)
- 100,000 record cycles (typical)
- On-chip clock source
- Programmer support for play-only applications
- Single +5 volt power supply
- Available in die form, PDIP, SOIC and TSOP packaging
- Temperature $=\operatorname{die}\left(0^{\circ} \mathrm{C}\right.$ to $\left.+50^{\circ} \mathrm{C}\right)$ and package $\left(0^{\circ} \mathrm{C}\right.$ to $\left.+70^{\circ} \mathrm{C}\right)$

## 5. PIN CONFIGURATION

* Same pinouts for ISD2575 / 2590 / 25120 products

## 6. PIN DESCRIPTION

| PIN NAME | PIN NO. |  | FUNCTION |
| :---: | :---: | :---: | :---: |
|  | SOIC/ PDIP | TSOP |  |
| Ax/Mx | $\begin{gathered} 1-10 / \\ 1-7 \end{gathered}$ | $\begin{aligned} & 8-171 \\ & 8-14 \end{aligned}$ | Address/Mode Inputs: The Address/Mode Inputs have two functions depending on the level of the two Most Significant Bits (MSB) of the address pins (A8 and A9). <br> If either or both of the two MSBs are LOW, the inputs are all interpreted as address bits and are used as the start address for the current record or playback cycle. The address pins are inputs only and do not output any internal address information during the operation. Address inputs are latched by the falling edge of CE. <br> If both MSBs are HIGH, the Address/Mode inputs are interpreted as Mode bits according to the Operational Mode table on page 12. There are six operational modes (M0...M6) available as indicated in the table. It is possible to use multiple operational modes simultaneously. Operational Modes are sampled on each falling edge of $\overline{C E}$, and thus Operational Modes and direct addressing are mutually exclusive. |
| AUX IN | 11 | 18 | Auxiliary Input: The Auxiliary Input is multiplexed through to the output amplifier and speaker output pins when $\overline{C E}$ is HIGH, P/R is HIGH, and playback is currently not active or if the device is in playback overflow. When cascading multiple ISD2500 devices, the AUX IN pin is used to connect a playback signal from a following device to the previous output speaker drivers. For noise considerations, it is suggested that the auxiliary input not be driven when the storage array is active. |
| $\mathrm{V}_{\text {SSA }}, \mathrm{V}_{\text {SSD }}$ | 13, 12 | 20, 19 | Ground: The ISD2500 series of devices utilizes separate analog and digital ground busses. These pins should be connected separately through a low-impedance path to power supply ground. |
| SP+/SP- | 14/15 | 21/22 | Speaker Outputs: All devices in the ISD2500 series include an onchip differential speaker driver, capable of driving 50 mW into $16 \Omega$ from AUX IN (12.2mW from memory). <br> ${ }^{[1]}$ The speaker outputs are held at $V_{\text {SSA }}$ levels during record and power down. It is therefore not possible to parallel speaker outputs of multiple ISD2500 devices or the outputs of other speaker drivers. <br> ${ }^{[2]}$ A single-end output may be used (including a coupling capacitor between the SP pin and the speaker). These outputs may be used individually with the output signal taken from either pin. However, the use of single-end output results in a 1 to 4 reduction in its output power. |

[^0]| PIN NAME | PIN NO. |  | FUNCTION |
| :---: | :---: | :---: | :---: |
|  | SOIC/ PDIP | TSOP |  |
| $\mathrm{V}_{\mathrm{CCA}}, \mathrm{V}_{\text {CCD }}$ | 16, 28 | 23, 7 | Supply Voltage: To minimize noise, the analog and digital circuits in the ISD2500 series devices use separate power busses. These voltage busses are brought out to separate pins and should be tied together as close to the supply as possible. In addition, these supplies should be decoupled as close to the package as possible. |
| MIC | 17 | 24 | Microphone: The microphone pin transfers input signal to the onchip preamplifier. A built-in Automatic Gain Control (AGC) circuit controls the gain of this preamplifier from -15 to 24 dB . An external microphone should be AC coupled to this pin via a series capacitor. The capacitor value, together with the internal $10 \mathrm{~K} \Omega$ resistance on this pin, determines the low-frequency cutoff for the ISD2500 series passband. See Winbond's Application Information for additional information on low-frequency cutoff calculation. |
| MIC REF | 18 | 25 | Microphone Reference: The MIC REF input is the inverting input to the microphone preamplifier. This provides a noise-canceling or common-mode rejection input to the device when connected to a differential microphone. |
| AGC | 19 | 26 | Automatic Gain Control: The AGC dynamically adjusts the gain of the preamplifier to compensate for the wide range of microphone input levels. The AGC allows the full range of whispers to loud sounds to be recorded with minimal distortion. The "attack" time is determined by the time constant of a $5 \mathrm{~K} \Omega$ internal resistance and an external capacitor ( C 2 on the schematic of Figure 5 in section 11) connected from the AGC pin to $V_{S S A}$ analog ground. The "release" time is determined by the time constant of an external resistor (R2) and an external capacitor (C2) connected in parallel between the AGC pin and $\mathrm{V}_{\text {SSA }}$ analog ground. Nominal values of $470 \mathrm{~K} \Omega$ and $4.7 \mu \mathrm{~F}$ give satisfactory results in most cases. |
| ANA IN | 20 | 27 | Analog Input: The analog input transfers analog signal to the chip for recording. For microphone inputs, the ANA OUT pin should be connected via an external capacitor to the ANA IN pin. This capacitor value, together with the $3.0 \mathrm{~K} \Omega$ input impedance of ANA IN , is selected to give additional cutoff at the low-frequency end of the voice passband. If the desired input is derived from a source other than a microphone, the signal can be fed, capacitively coupled, into the ANA IN pin directly. |
| ANA OUT | 21 | 28 | Analog Output: This pin provides the preamplifier output to the user. The voltage gain of the preamplifier is determined by the voltage level at the AGC pin. |

| PIN NAME | PIN NO. |  | FUNCTION |
| :---: | :---: | :---: | :---: |
|  | SOIC/ PDIP | TSOP |  |
| OVF | 22 | 1 | Overflow: This signal pulses LOW at the end of memory array, indicating the device has been filled and the message has overflowed. The $\overline{\text { OVF }}$ output then follows the $\overline{\mathrm{CE}}$ input until a PD pulse has reset the device. This pin can be used to cascade several ISD2500 devices together to increase record/playback durations. |
| CE | 23 | 2 | Chip Enable: The $\overline{\mathrm{CE}}$ input pin is taken LOW to enable all playback and record operations. The address pins and playback/record pin ( $P / \bar{R}$ ) are latched by the falling edge of $\overline{C E}$. $\overline{\mathrm{CE}}$ has additional functionality in the M6 (Push-Button) Operational Mode as described in the Operational Mode section. |
| PD | 24 | 3 | Power Down: When neither record nor playback operation, the PD pin should be pulled HIGH to place the part in standby mode (see $I_{S B}$ specification). When overflow (OVF) pulses LOW for an overflow condition, PD should be brought HIGH to reset the address pointer back to the beginning of the memory array. The PD pin has additional functionality in the M6 (Push-Button) Operation Mode as described in the Operational Mode section. |
| EOM | 25 | 4 | End-Of-Message: A nonvolatile marker is automatically inserted at the end of each recorded message. It remains there until the message is recorded over. The EOM output pulses LOW for a period of $\mathrm{T}_{\text {Еом }}$ at the end of each message. <br> In addition, the ISD2500 series has an internal $\mathrm{V}_{\mathrm{Cc}}$ detect circuit to maintain message integrity should $\mathrm{V}_{\mathrm{CC}}$ fall below 3.5 V . In this case, EOM goes LOW and the device is fixed in Playback-only mode. <br> When the device is configured in Operational Mode M6 (PushButton Mode), this pin provides an active-HIGH signal, indicating the device is currently recording or playing. This signal can conveniently drive an LED for visual indicator of a record or playback operation in process. |

## 7. FUNCTIONAL DESCRIPTION

### 7.1. Detailed Description

## Speech/Sound Quality

The Winbond's ISD2500 series includes devices offered at $4.0,5.3,6.4$, and 8.0 kHz sampling frequencies, allowing the user a choice of speech quality options. Increasing the duration within a product series decreases the sampling frequency and bandwidth, which affects the sound quality. Please refer to the ISD2560/75/90/120 Product Summary table below to compare the duration, sampling frequency and filter pass band.
The speech samples are stored directly into the on-chip nonvolatile memory without any digitization and compression associated like other solutions. Direct analog storage provides a very true, natural sounding reproduction of voice, music, tones, and sound effects not available with most solid state digital solutions.

## Duration

To meet various system requirements, the ISD2560/75/90/120 products offer single-chip solutions at $60,75,90$, and 120 seconds. Parts may also be cascaded together for longer durations.

TABLE 1: ISD2560/75/90/120 PRODUCT SUMMARY

| Part Number | Duration <br> (Seconds) | Input Sample <br> Rate (kHz) | Typical Filter Pass <br> Band *(kHz) |
| :---: | :---: | :---: | :---: |
| ISD2560 | 60 | 8.0 | 3.4 |
| ISD2575 | 75 | 6.4 | 2.7 |
| ISD2590 | 90 | 5.3 | 2.3 |
| ISD25120 | 120 | 4.0 | 1.7 |

* 3db roll-off point

## EEPROM Storage

One of the benefits of Winbond's ChipCorder ${ }^{\circledR}$ technology is the use of on-chip nonvolatile memory, providing zero-power message storage. The message is retained for up to 100 years typically without power. In addition, the device can be re-recorded typically over 100,000 times.

## Microcontroller Interface

In addition to its simplicity and ease of use, the ISD2500 series includes all the interfaces necessary for microcontroller-driven applications. The address and control lines can be interfaced to a microcontroller and manipulated to perform a variety of tasks, including message assembly, message concatenation, predefined fixed message segmentation, and message management.

## Programming

The ISD2500 series is also ideal for playback-only applications, where single or multiple messages are referenced through buttons, switches, or a microcontroller. Once the desired message configuration is created, duplicates can easily be generated via a gang programmer.

### 7.2. Operational Modes

The ISD2500 series is designed with several built-in Operational Modes that provide maximum functionality with minimum external components. These modes are described in details as below. The Operational Modes are accessed via the address pins and mapped beyond the normal message address range. When the two Most Significant Bits (MSB), A8 and A9, are HIGH, the remaining address signals are interpreted as mode bits and not as address bits. Therefore, Operational Modes and direct addressing are not compatible and cannot be used simultaneously.
There are two important considerations for using Operational Modes. First, all operations begin initially at address 0 of its memory. Later operations can begin at other address locations, depending on the Operational Mode(s) chosen. In addition, the address pointer is reset to 0 when the device is changed from record to playback, playback to record (except M6 mode), or when a Power-Down cycle is executed.

Second, Operational Modes are executed when $\overline{C E}$ goes LOW. This Operational Mode remains in effect until the next LOW-going CE signal, at which point the current mode(s) are sampled and executed.

TABLE 2: OPERATIONAL MODES

| Mode $^{[1]}$ | Function | Typical Use | Jointly Compatible ${ }^{[2]}$ |
| :---: | :--- | :--- | :--- |
| M0 | Message cueing | Fast-forward through messages | M4, M5, M6 |
| M1 | Delete $\overline{\mathrm{EOM}}$ markers | Position $\overline{\mathrm{EOM}}$ <br> the last message | M3, M4, M5, M6 |
| M2 | Not applicable the end of | Reserved | N/A |
| M3 | Looping | Continuous playback from Address 0 | M1, M5, M6 |
| M4 | Consecutive <br> addressing | Record/playback multiple <br> consecutive messages | M0, M1, M5 |
| M5 | $\overline{\text { CE level-activated }}$ | Allows message pausing | M0, M1, M3, M4 |
| M6 | Push-button control | Simplified device interface | M0, M1, M3 |

[1] Besides mode pin needed to be "1", A8 and A9 pin are also required to be " 1 " in order to enter into the related operational mode.
[2] Indicates additional Operational Modes which can be used simultaneously with the given mode.

### 7.2.1. Operational Modes Description

The Operational Modes can be used in conjunction with a microcontroller, or they can be hardwired to provide the desired system operation.

## M0 - Message Cueing

Message Cueing allows the user to skip through messages, without knowing the actual physical addresses of each message. Each CE LOW pulse causes the internal address pointer to skip to the next message. This mode is used for playback only, and is typically used with the M4 Operational Mode.

## M1 - Delete EOM Markers

The M1 Operational Mode allows sequentially recorded messages to be combined into a single message with only one EOM marker set at the end of the final message. When this Operational Mode is configured, messages recorded sequentially are played back as one continuous message.

## M2 - Unused

When Operational Modes are selected, the M2 pin should be LOW.

## M3 - Message Looping

The M3 Operational Mode allows for the automatic, continuously repeated playback of the message located at the beginning of the address space. A message can completely fill the ISD2500 device and will loop from beginning to end without $\overline{\text { OVF }}$ going LOW.

## M4 - Consecutive Addressing

During normal operation, the address pointer will reset when a message is played through an $\overline{\mathrm{EOM}}$ marker. The M4 Operational Mode inhibits the address pointer reset on EOM , allowing messages to be played back consecutively.

## M5 - CE -Level Activated

The default mode for ISD2500 devices is for $\overline{\mathrm{CE}}$ to be edge-activated on playback and levelactivated on record. The M5 Operational Mode causes the CE pin to be interpreted as levelactivated as opposed to edge-activated during playback. This is especially useful for terminating playback operations using the $\overline{\mathrm{CE}}$ signal. In this mode, $\overline{\mathrm{CE}}$ LOW begins a playback cycle, at the beginning of the device memory. The playback cycle continues as long as $\overline{\mathrm{CE}}$ is held LOW. When $\overline{\mathrm{CE}}$ goes HIGH, playback will immediately end. A new $\overline{\mathrm{CE}}$ LOW will restart the message from the beginning unless M4 is also HIGH.

## M6 - Push-Button Mode

The ISD2500 series contain a Push-Button Operational Mode. The Push-Button Mode is used primarily in very low-cost applications and is designed to minimize external circuitry and components, thereby reducing system cost. In order to configure the device in Push-Button Operational Mode, the two most significant address bits must be HIGH, and the M6 mode pin must also be HIGH. A device in this mode always powers down at the end of each playback or record cycle after $\overline{\mathrm{CE}}$ goes HIGH.
When this operational mode is implemented, three of the pins on the device have alternate functionality as described in the table below.

TABLE 3: ALTERNATE FUNCTIONALITY IN PINS

| Pin Name | Alternate Functionality in Push-Button Mode |
| :--- | :--- |
| $\overline{\mathrm{CE}}$ | Start/Pause Push-Button (LOW pulse-activated) |
| PD | Stop/Reset Push-Button (HIGH pulse-activated) |
| $\overline{\mathrm{EOM}}$ | Active-HIGH Run Indicator |

## CE (START/PAUSE)

In Push-Button Operational Mode, $\overline{\mathrm{CE}}$ acts as a LOW-going pulse-activated START/PAUSE signal. If no operation is currently in progress, a LOW-going pulse on this signal will initiate a playback or record cycle according to the level on the $P / \bar{R}$ pin. A subsequent pulse on the $\overline{C E}$ pin, before an EOM is reached in playback or an overflow condition occurs, will pause the current operation, and the address counter is not reset. Another $\overline{\mathrm{CE}}$ pulse will cause the device to continue the operation from the place where it is paused.

## PD (STOP/RESET)

In Push-Button Operational Mode, PD acts as a HIGH-going pulse-activated STOP/RESET signal. When a playback or record cycle is in progress and a HIGH-going pulse is observed on PD, the current cycle is terminated and the address pointer is reset to address 0 , the beginning of the message space.

## EOM (RUN)

In Push-Button Operational Mode, $\overline{\mathrm{EOM}}$ becomes an active-HIGH RUN signal which can be used to drive an LED or other external device. It is HIGH whenever a record or playback operation is in progress.

## Recording in Push-Button Mode

1. The PD pin should be LOW, usually using a pull-down resistor.
2. The $P / \bar{R}$ pin is taken LOW.
3. The CE pin is pulsed LOW. Recording starts, EOM goes HIGH to indicate an operation in progress.
4. When the CE pin is pulsed LOW. Recording pauses, EOM goes back LOW. The internal address pointers are not cleared, but the EOM marker is stored in memory to indicate as the message end. The P/R pin may be taken HIGH at this time. Any subsequent $\overline{\mathrm{CE}}$ would start a playback at address 0 .
5. The $\overline{\mathrm{CE}}$ pin is pulsed LOW. Recording starts at the next address after the previous set EOM marker. EOM goes back HIGH. ${ }^{[3]}$
6. When the recording sequences are finished, the final CE pulse LOW will end the last record cycle, leaving a set $\overline{E O M}$ marker at the message end. Recording may also be terminated by a HIGH level on PD, which will leave a set EOM marker.

## Playback in Push-Button Mode

1. The PD pin should be LOW.
2. The $P / \bar{R}$ pin is taken HIGH.
3. The $\overline{\mathrm{CE}}$ pin is pulsed LOW. Playback starts, $\overline{\mathrm{EOM}}$ goes HIGH to indicate an operation in progress.
4. If the CE pin is pulsed LOW or an EOM marker is encountered during an operation, the part will pause. The internal address pointers are not cleared, and EOM goes back LOW. The P/ $\bar{R}$ pin may be changed at this time. A subsequent record operation would not reset the address pointers and the recording would begin where playback ended.
5. $\overline{\mathrm{CE}}$ is again pulsed LOW. Playback starts where it left off, with $\overline{\mathrm{EOM}}$ going HIGH to indicate an operation in progress.
6. Playback continues as in steps 4 and 5 until PD is pulsed HIGH or overflow occurs.
7. If in overflow, pulling CE LOW will reset the address pointer and start playback from the beginning. After a PD pulse, the part is reset to address 0.

Note: Push-Button Mode can be used in conjunction with modes M0, M1, and M3.
${ }^{\text {[3] }}$ If the M1 Operational Mode pin is also HIGH, the just previously written EOM bit is erased, and recording starts at that address.

## Good Audio Design Practices

Winbond products are very high-quality single-chip voice recording and playback systems. To ensure the highest quality voice reproduction, it is important that good audio design practices on layout and power supply decoupling be followed. See Application Information or below links for details.

Good Audio Design Practices
http://www.winbond-usa.com/products/isd products/chipcorder/applicationinfo/apin11.pdf

## Single-Chip Board Layout Diagrams

http://www.winbond-usa.com/products/isd products/chipcorder/applicationinfo/apin12.pdf
8. TIMING DIAGRAMS

FIGURE 1: RECORD

FIGURE 2: PLAYBACK

FIGURE 3: PUSH-BUTTON MODE RECORD

FIGURE 4: PUSH-BUTTON MODE PLAYBACK

Notes for Push-Button modes:

1. $\mathrm{A} 9, \mathrm{~A} 8$, and $\mathrm{A} 6=1$ for push-button operation.
2. The first $\overline{C E}$ LOW pulse performs a start function.
3. The part will begin to play or record after a power-up delay $T_{\text {Pud }}$.
4. The part must have CE HIGH for a debounce period $T_{D B}$ before it will recognize another falling edge of CE and pause.
5. The second CE LOW pulse, and every even pulse thereafter, performs a Pause function.
6. Again, the part must have $\overline{\mathrm{CE}}$ HIGH for a debounce period $\mathrm{T}_{\mathrm{DB}}$ before it will recognize another falling edge of CE, which would restart an operation. In addition, the part will not do an internal power down until $\overline{C E}$ is HIGH for the $T_{D B}$ time.
7. The third $\overline{C E}$ LOW pulse, and every odd pulse thereafter, performs a Resume function.
8. At any time, a HIGH level on PD will stop the current function, reset the address counter, and power down the device.

## 9. ABSOLUTE MAXIMUM RATINGS

TABLE 4: ABSOLUTE MAXIMUM RATINGS (DIE)

| CONDITION | VALUE |
| :--- | :--- |
| Junction temperature | $150^{\circ} \mathrm{C}$ |
| Storage temperature range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Voltage applied to any pad | $\left(\mathrm{V}_{\mathrm{SS}}-0.3 \mathrm{~V}\right)$ to <br> $\left(\mathrm{V}_{\mathrm{CC}}+0.3 \mathrm{~V}\right)$ |
| Voltage applied to any pad (Input current limited to $\pm 20 \mathrm{~mA})$ | $\left(\mathrm{V}_{\mathrm{SS}}-1.0 \mathrm{~V}\right)$ to <br> $\left(\mathrm{V}_{\mathrm{CC}}+1.0 \mathrm{~V}\right)$ |
| $\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{SS}}$ | -0.3 V to +7.0 V |

TABLE 5: ABSOLUTE MAXIMUM RATINGS (PACKAGED PARTS)

| CONDITION | VALUE |
| :--- | :--- |
| Junction temperature | $150^{\circ} \mathrm{C}$ |
| Storage temperature range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Voltage applied to any pin | $\left(\mathrm{V}_{\mathrm{SS}}-0.3 \mathrm{~V}\right)$ to <br> $\left(\mathrm{V}_{\mathrm{CC}}+0.3 \mathrm{~V}\right)$ |
| Voltage applied to any pin (Input current limited to $\pm 20 \mathrm{~mA})$ | $\left(\mathrm{V}_{\mathrm{SS}}-1.0 \mathrm{~V}\right)$ to <br> $\left(\mathrm{V}_{\mathrm{CC}}+1.0 \mathrm{~V}\right)$ |
| Lead temperature (Soldering -10sec) | $300^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{SS}}$ | -0.3 V to +7.0 V |

Note: Stresses above those listed may cause permanent damage to the device. Exposure to the absolute maximum ratings may affect device reliability and performance. Functional operation is not implied at these conditions.

### 9.1 Operating Conditions

TABLE 6: OPERATING CONDITIONS (DIE)

| CONDITION | VALUE |
| :--- | :--- |
| Commercial operating temperature range | $0^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$ |
| Supply voltage $\left(\mathrm{V}_{\mathrm{CC}}\right)^{[1]}$ | +4.5 V to +6.5 V |
| Ground voltage $\left(\mathrm{V}_{\mathrm{SS}}\right)^{[2]}$ | 0 V |

TABLE 7: OPERATING CONDITIONS (PACKAGED PARTS)

11. TYPICAL APPLICATION CIRCUIT

FIGURE 5: DESIGN SCHEMATIC

Note: If desired, pin 18 (PDIP package) may be left unconnected (microphone preamplifier noise will be higher). In this case, pin 18 must not be tied to any other signal or voltage. Additional design example schematics are provided below.

TABLE 13: APPLICATION EXAMPLE - BASIC DEVICE CONTROL

| Control Step | Function | Action |
| :--- | :--- | :--- |
| 1 | Power up chip and select Record/Playback Mode | 1. PD $=$ LOW, 2. P/ $\bar{R}=$ As desired |
| 2 | Set message address for record/playback | Set addresses A0-A9 |
| $3 A$ | Begin playback | $\mathrm{P} / \overline{\mathrm{R}}=\mathrm{HIGH}, \overline{\mathrm{CE}}=$ Pulse LOW |
| $3 B$ | Begin record | $\mathrm{P} / \overline{\mathrm{R}}=\mathrm{LOW}, \overline{\mathrm{CE}}=\mathrm{LOW}$ |
| 4 A | End playback | Automatic |
| $4 B$ | PD record | $\overline{\mathrm{CE}}=\mathrm{HIGH}$ |

TABLE 14: APPLICATION EXAMPLE - PASSIVE COMPONENT FUNCTIONS

| Part | Function | Comments |
| :--- | :--- | :--- |
| R1 | Microphone power supply decoupling | Reduces power supply noise |
| R2 | Release time constant | Sets release time for AGC |
| R3, R5 | Microphone biasing resistors | Provides biasing for microphone operation |
| R4 | Series limiting resistor | Reduces level to prevent distortion at <br> higher supply voltages |
| R6 | Series limiting resistor | Reduces level to high supply voltages |
| C1, C5 | Microphone DC-blocking capacitor Low- <br> frequency cutoff | Decouples microphone bias from chip. <br> Provides single-pole low-frequency cutoff <br> and command mode noise rejection. |
| C2 | Attack/Release time constant | Sets attack/release time for AGC |
| C3 | Low-frequency cutoff capacitor | Provides additional pole for low-frequency <br> cutoff |
| C4 | Microphone power supply decoupling | Reduces power supply noise |
| C6, C7, C8 | Power supply capacitors | Filter and bypass of power supply |

FIGURE 6: ISD2560/75/90/120 APPLICATION EXAMPLE - MICROCONTROLLER/ISD2500 INTERFACE

In this simplified block diagram of a microcontroller application, the Push-Button Mode and message cueing are used. The microcontroller is a 16-pin version with enough port pins for buttons, an LED, and the ISD2500 series device. The software can be written to use three buttons: one each for play and record, and one for message selection. Because the microcontroller is interpreting the buttons and commanding the ISD2500 device, software can be written for any function desired in a particular application.

Note: Winbond does not recommend connecting address lines directly to a microprocessor bus. Address lines should be externally latched.

FIGURE 7: ISD2560/75/90/120 APPLICATION EXAMPLE - PUSH-BUTTON

Note: Please refer to page 13 for more details.

TABLE 15: APPLICATION EXAMPLE - PUSH-BUTTON CONTROL

| Control Step | Function | Action |
| :--- | :--- | :--- |
| 1 | Select Record/Playback Mode | $\mathrm{P} / \overline{\mathrm{R}}=\mathrm{As}$ desired |
| 2 Be | Begin playback | $\mathrm{P} / \overline{\mathrm{R}}=\mathrm{HIGH}, \overline{\mathrm{CE}}=$ Pulse LOW |
| 2 B | Begin record | $\mathrm{P} / \overline{\mathrm{R}}=\mathrm{LOW}, \overline{\mathrm{CE}}=$ Pulse LOW |
| 3 | Pause record or playback | $\overline{\mathrm{CE}}=$ Pulsed LOW |
| 4 A | End playback | Automatic at $\overline{\mathrm{EOM}}$ marker or PD = Pulsed HIGH |
| $4 B$ | End record | PD = Pulsed HIGH |

TABLE 16: APPLICATION EXAMPLE - PASSIVE COMPONENT FUNCTIONS

| Part | Function | Comments |
| :--- | :--- | :--- |
| R2 | Release time constant | Sets release time for AGC |
| R4 | Series limiting resistor | Reduces level to prevent distortion at <br> higher supply voltages |
| R6, R7 | Pull-up and pull-down resistors | Defines static state of inputs |
| C1, C4, C5 | Power supply capacitors | Filters and bypass of power supply |
| C2 | Attack/Release time constant | Sets attack/release time for AGC |
| C3 | Low-frequency cutoff capacitor | Provides additional pole for low-frequency <br> cutoff |

12.4. ISD2560/75/95/120 Product Bonding Physical Layout (Die) ${ }^{[1]}$

## ISD2560/75/95/120

- Die Dimensions
$X: 149.5 \pm 1$ mils
Y: $262.0 \pm 1$ mils
- Die Thickness ${ }^{[2]}$
$11.8 \pm .4$ mils
- Pad Opening
$111 \times 111$ microns
$4.4 \times 4.4$ mils

Notes:
${ }^{[1]}$ The backside of die is internally connected to $\mathrm{V}_{\text {Ss }}$. It MUST NOT be connected to any other potential or damage may occur.
${ }^{[2]}$ Die thickness is subject to change, please contact Winbond factory for status and availability.

## ISD2560/75/90/120

ISD2560/75/90/120 PRODUCT PAD DESIGNATIONS
(with respect to die center)

| Pad | Pad Name | X Axis ( $\mu \mathrm{m}$ ) | Y Axis ( $\mu \mathrm{m}$ ) |
| :---: | :---: | :---: | :---: |
| A0 | Address 0 | -897.9 | 3135.2 |
| A1 | Address 1 | -1115.4 | 3135.2 |
| A2 | Address 2 | -1331.0 | 3135.2 |
| A3 | Address 3 | -1544.0 | 3135.2 |
| A4 | Address 4 | -1640.4 | 2888.9 |
| A5 | Address 5 | -1698.2 | 2671.0 |
| A6 | Address 6 | -1698.2 | 2441.5 |
| A7 | Address 7 | -1731.2 | -2583.2 |
| A8 | Address 8 | -1731.2 | -2768.4 |
| A9 | Address 9 | -1731.2 | -3050.8 |
| AUX IN | Auxiliary Input | -1410.2 | -3115.7 |
| $V_{\text {SSD }}$ | $V_{\text {SS }}$ Digital Power Supply | -1112.4 | -3096.5 |
| $V_{\text {SSA }}$ | $\mathrm{V}_{\text {ss }}$ Analog Power Supply | -408.2 | -3138.9 |
| SP+ | Speaker Output + | -46.65 | -3068.4 |
| SP- | Speaker Output - | 386.1 | -3068.4 |

| XCLK | No Connect (optional) | 986.5 | 3160.7 |
| P/R | Playback/Record | 807.2 | 3163.4 |
| $\mathrm{V}_{\text {CCD }}$ | $\mathrm{V}_{\mathrm{CC}}$ Digital Power Supply | 544.4 | 3159.6 |

## 13. ORDERING INFORMATION

## Product Number Descriptor Key

When ordering ISD2560/75/90/120 products refer to the following part numbers which are supported in volume for this product series. Consult the local Winbond Sales Representative or Distributor for availability information.

| Part Number | Part Number | Part Number | Part Number |
| :---: | :---: | :---: | :---: |
| ISD2560P | ISD2575P | ISD2590P | ISD25120P |
| ISD2560S | ISD2575S | ISD2590S | ISD25120S |
| ISD2560E | ISD2575E | ISD2590E |  |
| ISD2560X | ISD2575X | ISD2590X | ISD25120X |

For the latest product information, access Winbond's worldwide website at http://www.winbond-usa.com
14. VERSION HISTORY

| VERSION | DATE | PAGE | DESCRIPTION |
| :---: | :---: | :---: | :--- |
| 0 | Apr. 1998 | All | Preliminary Specifications |
| 1.0 | May 2003 | All | Re-format the document. <br> Update TSOP pin configuration. <br> Revise Overflow pad designation. |
