

8-bit Proprietary Microcontroller

CMOS

F²MC-8L MB89650AR Series

MB89653AR/655AR/656AR/657AR/P657A MB89PV650A

■ DESCRIPTION

The MB89650AR series has been developed as a general-purpose version of the F²MC*-8L family consisting of proprietary 8-bit, single-chip microcontrollers.

In addition to a compact instruction set, the microcontrollers contain a variety of peripheral functions such as dual-clock control system, five operating speed control stages, timers, PWM timers, a serial interface, an A/D converter, external interrupts, an LCD controller/driver, and a watch prescaler.

*: F²MC stands for FUJITSU Flexible Microcontroller.

■ FEATURES

- F²MC-8L family CPU core
- Dual-clock control system
- Maximum memory space: 64 Kbytes
- Minimum execution time: 0.4 μ s/10 MHz
- Interrupt processing time: 3.6 μ s/10 MHz
- I/O ports: max. 64 channels
- 21-bit time-base counter
- 8-bit PWM timers: 2 channels (A maximum of 4 channels can be used for output.)
- 8/16-bit timer/counter: 4 channels (16 bits \times 2 channels)
- 8-bit serial I/O: 1 channel
- 8-bit A/D converter: 8 channels

(Continued)

■ PACKAGE

100-pin Plastic SQFP

(FPT-100P-M05)

100-pin Plastic QFP

(FPT-100P-M06)

100-pin Ceramic MQFP

(MQP-100C-P02)

MB89650AR Series

(Continued)

- External interrupt 1
Four independent channels with edge detection function
- External interrupt 2 (wake-up function)
Twelve “L” level-interrupt channels
- Watch prescaler
- LCD controller/driver: 16 to 32 segments × 2 to 4 commons
- Power-on reset function
- Low-power consumption modes (subclock mode, watch mode, sleep mode, and stop mode)
- SQFP-100 and QFP-100 packages

■ PRODUCT LINEUP

Part number	MB89653AR	MB89655AR	MB89656AR	MB89657AR	MB89P657A	MB89PV650A
Classification	Mass production products (mask ROM products)				One-time PROM product	Piggyback/ evaluation product (for evaluation and development)
ROM size	8 K × 8 bits (internal mask ROM)	16 K × 8 bits (internal mask ROM)	24 K × 8 bits (internal mask ROM)	32 K × 8 bits (internal mask ROM)	32 K × 8 bits (internal PROM, programming with general- purpose EPROM programmer)	32 K × 8 bits (external ROM)
RAM size	256 × 8 bits	512 × 8 bits	768 × 8 bits	1 K × 8 bits		
LCD display RAM	16 × 8 bits					
CPU functions	Number of instructions: 136 Instruction bit length: 8 bits Instruction length: 1 to 3 bytes Data bit length: 1, 8, 16 bits Minimum execution time: 0.4 μs/10 MHz to 6.4 μs/10 MHz, 61.0 μs/32.768 kHz Interrupt processing time: 3.6 μs/10 MHz to 57.6 μs/10 MHz, 549.3 μs/32.768 kHz					
Ports	Input ports: 8 (All also serve as peripherals.) Output ports: 8 (All also serve as peripherals.) I/O ports: 48 (All also serve as peripherals.) Total: 64					
8-bit timer 1, 8-bit timer 2	8-bit timer operation (toggled output capable, operating clock cycle: 0.8 to 12.8 μs) 16-bit timer operation (toggled output capable, operating clock cycle: 0.8 to 12.8 μs) 2 output channels are enabled when operating as an 8-bit timer.					
8-bit timer 3, 8-bit timer 4	8-bit timer operation (toggled output capable, operating clock cycle: 0.8 to 12.8 μs) 16-bit timer operation (toggled output capable, operating clock cycle: 0.8 to 12.8 μs) 2 output channels are enabled when operating as an 8-bit timer.					
Clock timer	21 bits × 1 (in main clock mode)/15 bits × 1 (at 32.768 kHz)					
8-bit PWM timer 1, 8-bit PWM timer 2	8-bit reload timer operation (toggled output capable, operating clock cycle: 0.4 μs to 3.3 ms) 8-bit resolution PWM operation (conversion cycle: 102 μs to 839 ms) Both 8-bit PWM timer 1 and 8-bit PWM timer 2 can output 2 channels.

Part number	MB89653AR	MB89655AR	MB89656AR	MB89657AR	MB89P657A	MB89PV650A
8-bit serial I/O	8 bits LSB first/MSB first selectability One clock selectable from four transfer clocks (one external shift clock, three internal shift clocks: 0.8 μ s, 3.2 μ s, 12.8 μ s)					
8-bit A/D converter	8-bit resolution \times 8 channels A/D conversion mode (conversion time: 18 μ s) Sense mode (conversion time: 5 μ s) Continuous activation by an internal timer capable Reference voltage input					
External interrupt 1	4 independent channels (edge selection) Rising edge/falling edge selectability Used also for wake-up from stop/sleep mode. (Edge detection is also permitted in stop mode.)					
External interrupt 2 (wake-up function)	"L" level interrupt \times 12 channels					
Standby mode	Subclock mode, sleep mode, watch mode, and stop mode					
Process	CMOS					
Operating voltage*	2.2 V to 6.0 V				2.7 V to 6.0 V	
EPROM for use	—					MBM27C256A-20TVM

* : Varies with conditions such as the operating frequency. (See section "■ Electrical Characteristics.")
In the case of the MB89PV650A, the voltage varies with the restrictions of the EPROM for use.

MB89650AR Series

■ DIFFERENCES AMONG PRODUCTS

1. Memory Size

Before evaluating using the piggyback product, verify its differences from the product that will actually be used. Take particular care on the following points:

- On the MB89653AR, the upper half of the register bank cannot be used.
- On the MB89P657A, the program area starts from address 8006_H but on the MB89PV650A and MB89657AR starts from 8000_H.

(On the MB89P657A, addresses 8000_H to 8005_H comprise the option setting area, option settings can be read by reading these addresses. On the MB89PV650A and MB89657A, addresses 8000_H to 8005_H could also be used as a program ROM. However, do not use these addresses in order to maintain compatibility of the MB89P657A.)

- The stack area, etc., is set at the upper limit of the RAM.

2. Current Consumption

- In the case of the MB89PV650A, add the current consumed by the EPROM which is connected to the top socket.
- When operated at low speed, the product with an OTPROM (one-time PROM) or an EPROM will consume more current than the product with a mask ROM.

However, the current consumption in sleep/stop modes is the same. (For more information, see sections “■ Electrical Characteristics” and “■ Example Characteristics.”)

3. Mask Options

Functions that can be selected as options and how to designate these options vary by the product.

Before using options check section “■ Mask Options.”

Take particular care on the following points:

- A pull-up resistor cannot be set for P70 to P75 on the MB89P657A. On this product, a pull-up resistor must be selected in a group of four bits for P14 to P17, P40 to P43, and P44 to P47.
- A pull-up resistor is not selectable for P30 to P37 and P40 to P47 if they are used as LCD pins.
- Options are fixed on the MB89PV650A.

4. Differences between the MB89650A and MB89650AR Series

- Electrical specifications/electrical characteristics
Electrical specifications of the MB89650AR series are the same with that of the MB89650A series.
Electrical characteristics of both series are much the same.
- Oscillation circuit type
In the MB89650A series, the circuit type of using an external clock differs from that of using a crystal or ceramic resonator as follows.
Circuit type of the MB89650AR series is a circuit type in using external clock even when crystal or ceramic resonator is selected.
- Memory access area and other specifications of both the MB89650A and MB89650AR series are the same.

■ PIN DESCRIPTION

Pin no.		Pin name	Circuit type	Function
QFP*1	MQFP*2 SQFP*3			
4	1	MOD0	J	Operating mode selection pins Connect to V _{SS} (GND) when using.
5	2	MOD1		
6	3	X0	A	Main clock crystal oscillator pins (max. 10 MHz)
7	4	X1		
8	5	V _{SS}	—	Power supply (GND) pin
9	6	\overline{RST}	J	Reset input pin
10 to 17	7 to 14	P00/ $\overline{INT20}$ to P07/ $\overline{INT27}$	F	General-purpose I/O ports Also serve as an external interrupt 2 input (wake-up function). External interrupt 2 input ($\overline{INT20}$ to $\overline{INT27}$) is hysteresis input while port input (P00 to P07) is CMOS input.
18 to 21	15 to 18	P10/ $\overline{INT10}$ to P13/ $\overline{INT13}$	F	General-purpose I/O ports Also serve as an external interrupt 1 input. External interrupt 1 input ($\overline{INT10}$ to $\overline{INT13}$) is hysteresis input while port input (P10 to P13) is CMOS input.
22 to 25	19 to 22	P14/ $\overline{INT28}$ to P15/ $\overline{INT2B}$	F	General-purpose I/O ports Also serve as an external interrupt 2 input (wake-up function). External interrupt 2 input ($\overline{INT28}$ to $\overline{INT2B}$) is hysteresis input while port input (P14 to P17) is CMOS input.
26 to 28	23 to 25	P20 to P22	C	General-purpose I/O ports
29, 30, 31	26, 27, 28	P24/SI, P25/SO, P26/SCK	F	General-purpose I/O ports The output type can be switched between N-ch open-drain and CMOS. These ports also serve as an 8-bit serial I/O. The P26/SCK pin is a CMOS input type when it functions as the port input (P26) while the pin is a hysteresis input type when it functions as the serial clock input (SCK).
32 to 47	29 to 44	P36/SEG31 to P47/SEG26	H	General-purpose I/O ports Also serve as an LCD controller/driver segment output.
48, 49	45, 46	SEG15, SEG14	I	LCD controller/driver segment output pins

K		<ul style="list-style-type: none"> • Hysteresis input • N-ch open-drain output • Pull-up resistor optional

■ HANDLING DEVICES

1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than V_{CC} or lower than V_{SS} is applied to input and output pins other than medium- to high-voltage pins or if higher than the voltage which shows on “1. Absolute Maximum Ratings” in section “■ Electrical Characteristics” is applied between V_{CC} and V_{SS} .

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

Also, take care to prevent the analog power supply (AV_{CC} and AVR) and analog input from exceeding the digital power supply (V_{CC}) when the analog system power supply is turned on and off.

2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistor.

3. Treatment of Power Supply Pins on Microcontrollers with A/D and D/A Converters

Connect to be $AV_{CC} = DAVC = V_{CC}$ and $AV_{SS} = AVR = V_{SS}$ even if the A/D and D/A converters are not in use.

4. Treatment of N.C. Pins

Be sure to leave (internally connected) N.C. pins open.

5. Power Supply Voltage Fluctuations

Although V_{CC} power supply voltage is assured to operate within the rated range, a rapid fluctuation of the voltage could cause malfunctions, even if it occurs within the rated range. Stabilizing voltage supplied to the IC is therefore important. As stabilization guidelines, it is recommended to control power so that V_{CC} ripple fluctuations (P-P value) will be less than 10% of the standard V_{CC} value at the commercial frequency (50 to 60 Hz) and the transient fluctuation rate will be less than 0.1 V/ms at the time of a momentary fluctuation such as when power is switched.

6. Precautions when Using an External Clock

Even when an external clock is used, oscillation stabilization time is required for power-on reset (optional) and wake-up from stop mode.

■ PROGRAMMING TO THE EPROM ON THE MB89P657A

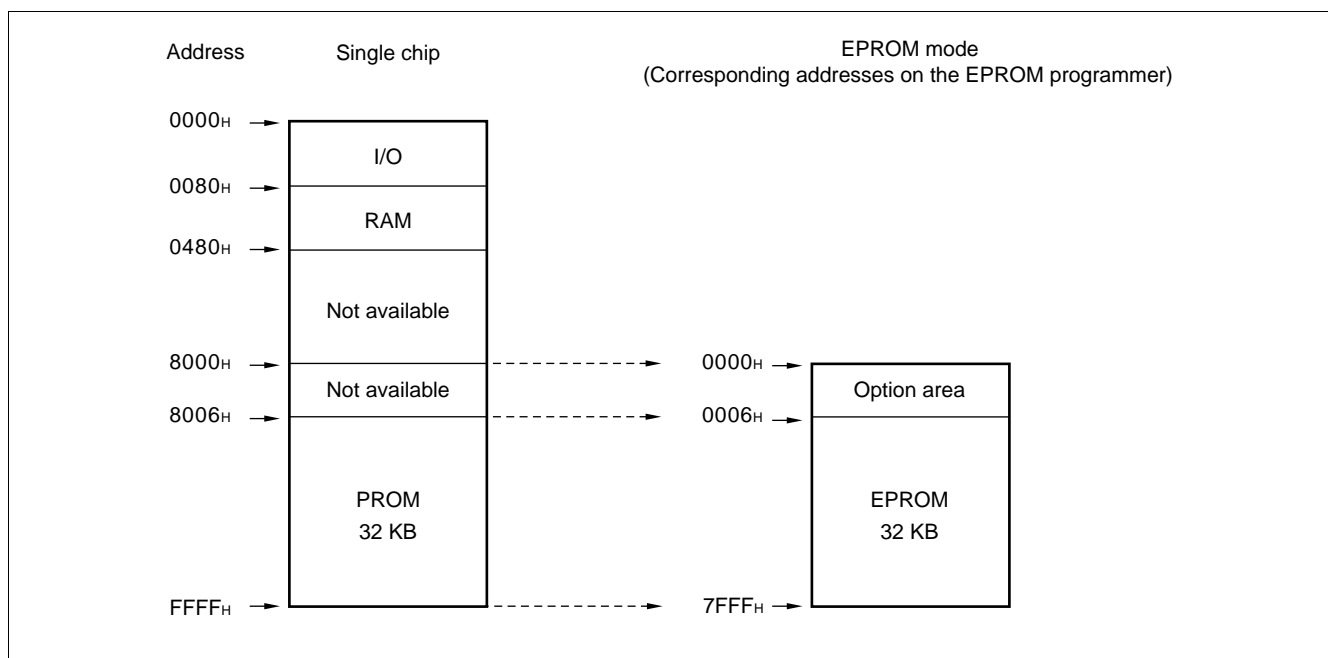

The MB89P657A is an OTPROM version of the MB89650A series.

1. Features

- 32-Kbyte PROM on chip
- Options can be set using the EPROM programmer.
- Equivalency to the MBM27C256A in EPROM mode (when programmed with the EPROM programmer)

2. Memory Space

Memory space in each mode such as 32-Kbyte PROM, option area is diagrammed below.

3. Programming to the EPROM

In EPROM mode, the MB89P657A functions equivalent to the MBM27C256A. This allows the PROM to be programmed with a general-purpose EPROM programmer (the electronic signature mode cannot be used) by using the dedicated socket adapter.

When the operating ROM area for a single chip is 32 Kbytes (8006_H to FFFF_H) the PROM can be programmed as follows:

• Programming procedure

- (1) Set the EPROM programmer to the MBM27C256A.
- (2) Load program data into the EPROM programmer at 0006_H to 7FFF_H (note that addresses 8006_H to FFFF_H while operating as a single chip assign to 0006_H to 7FFF_H in EPROM mode).
Load option data into addresses 0000_H to 0005_H of the EPROM programmer. (For information about each corresponding option, see "7. Setting OTPROM Options.")
- (3) Program to 0000_H to 7FFF_H with the EPROM programmer.

MB89650AR Series

4. Recommended Screening Conditions

High-temperature aging is recommended as the pre-assembly screening procedure for a product with a blanked OTPROM microcomputer program.

5. Programming Yield

All bits cannot be programmed at Fujitsu shipping test to a blanked OTPROM microcomputer, due to its nature. For this reason, a programming yield of 100% cannot be assured at all times.

6. EPROM Programmer Socket Adapter

Package	Compatible socket adapter
FPT-100P-M05	ROM-100SQF-28DP-8L
FPT-100P-M06	ROM-100QF-28DP-8L2

Inquiry: Sun Hayato Co., Ltd.: TEL 81-3-3802-5760

Note: Connect the ROM-100SQF-28DP-8L jumper pin to V_{SS} when using.
Depending on the EPROM programmer, inserting a capacitor of about 0.1 μF between V_{PP} and V_{SS} or V_{CC} and V_{SS} can stabilize programming operations.

7. Setting OTPROM Options

The programming procedure is the same as that for the PROM. Options can be set by programming values at the addresses shown on the memory map. The relationship between bits and options is shown on the following bit map:

- **OTPROM option bit map**

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

0005 _H	Vacancy Readable and writable	Vacancy Readable and writable	Vacancy Readable and writable	P17 to P14 Pull-up 1: No 0: Yes	P13 Pull-up 1: No 0: Yes	P12 Pull-up 1: No 0: Yes	P11 Pull-up 1: No 0: Yes	P10 Pull-up 1: No 0: Yes

- Notes:
- Set each bit to 1 to erase.
 - Do not write 0 to the vacant bit.
The read value of the vacant bit is 1, unless 0 is written to it.

MB89650AR Series

■ PROGRAMMING TO THE EPROM WITH PIGGYBACK/EVALUATION DEVICE

1. EPROM for Use

MBM27C256A-20TVM

2. Programming Socket Adapter

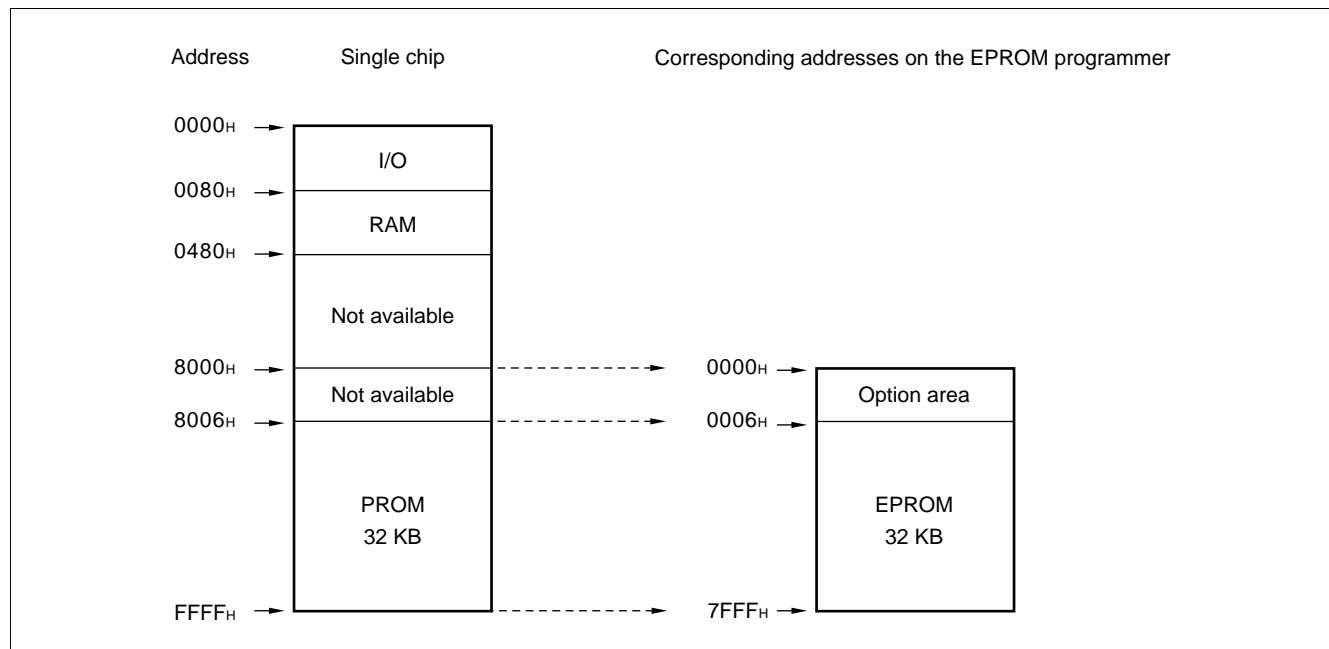

To program to the PROM using an EPROM programmer, use the socket adapter (manufacturer: Sun Hayato Co., Ltd.) listed below.

Package	Adapter socket part number
LCC-32(Rectangle)	ROM-32LC-28DP-YG
LCC-32(Square)	ROM-32LC-28DP-S

Inquiry: Sun Hayato Co., Ltd.: TEL 81-3-3802-5760

3. Memory Space

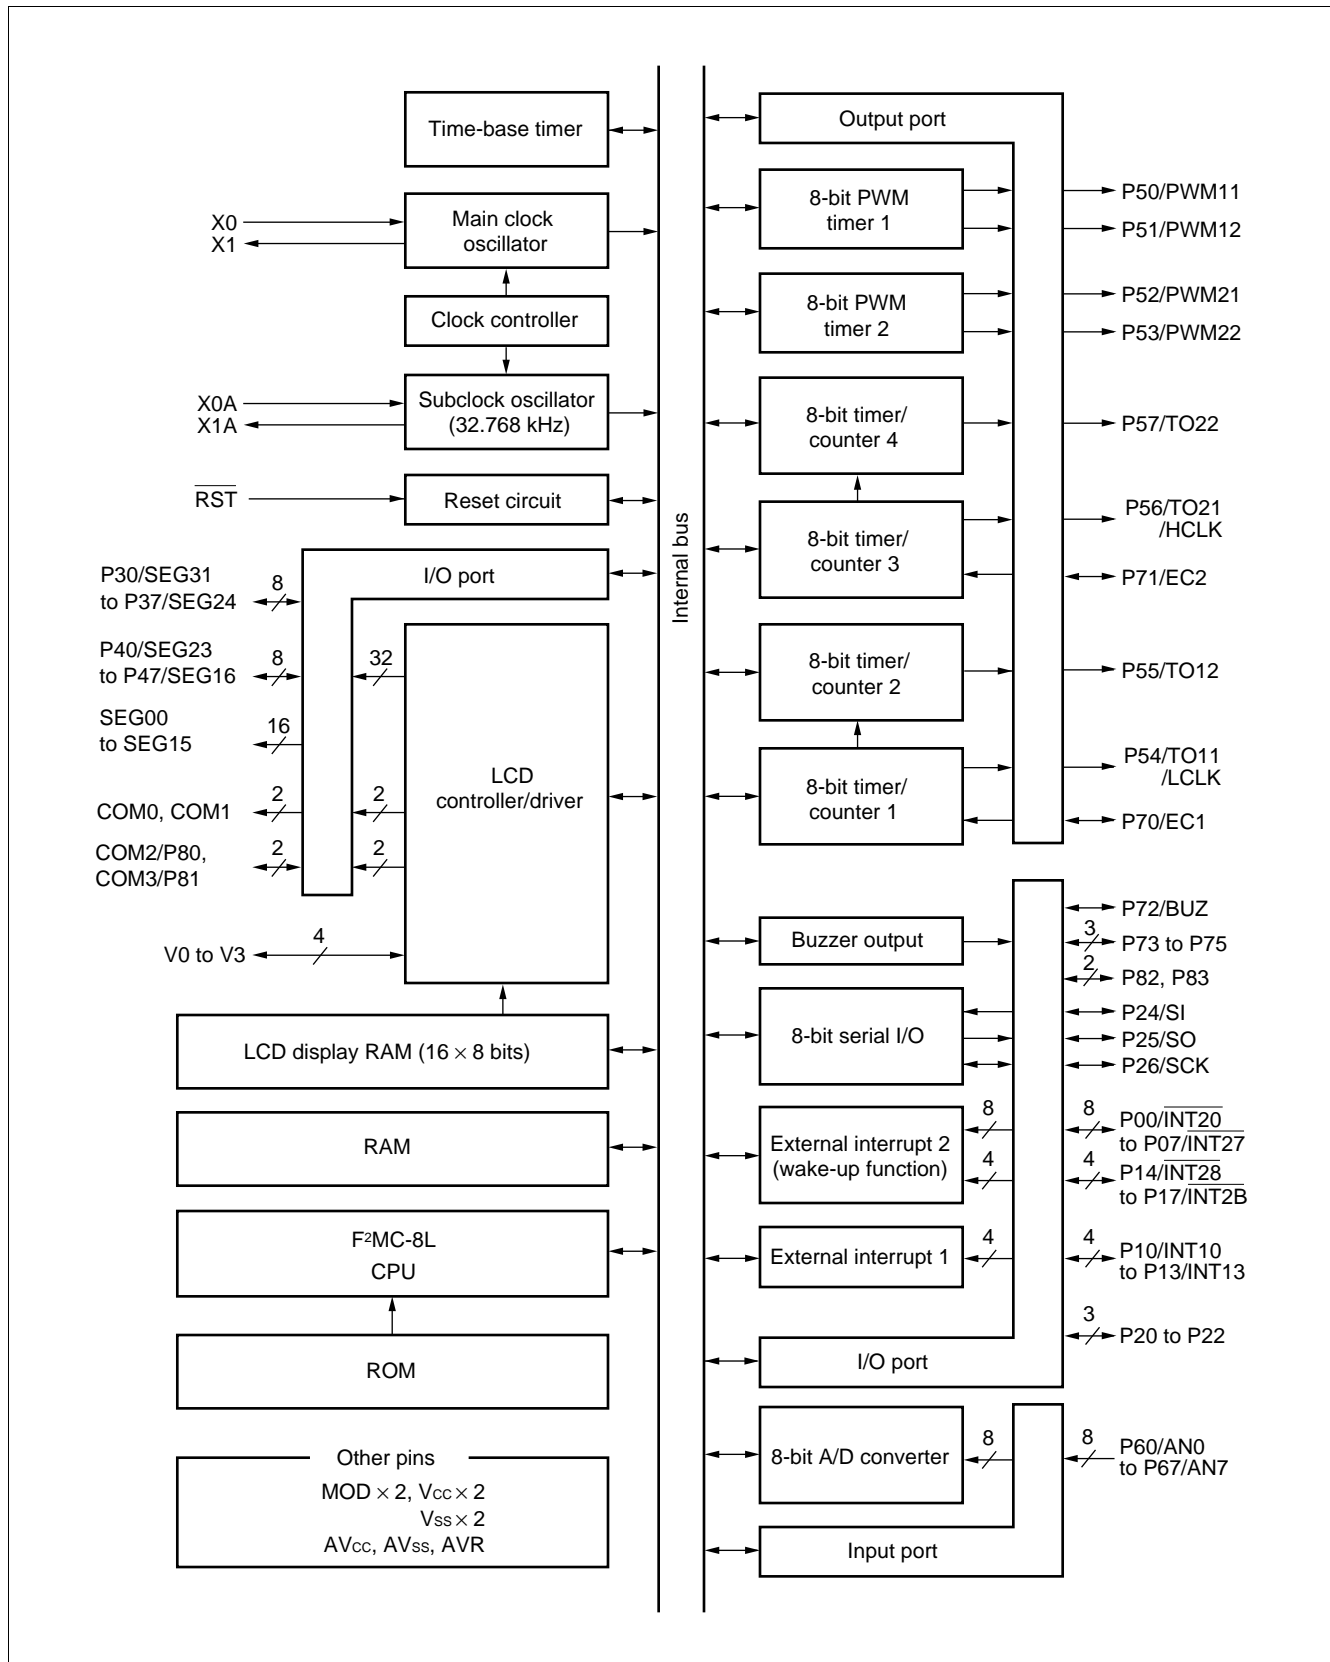

Memory space in each mode, such as 32-Kbyte PROM, option area is diagrammed below.

4. Programming to the EPROM

- (1) Set the EPROM programmer to the MBM27C256A.
- (2) Load program data into the EPROM programmer at 0006H to 7FFFH.
- (3) Program to 0000H to 7FFFH with the EPROM programmer.

■ BLOCK DIAGRAM

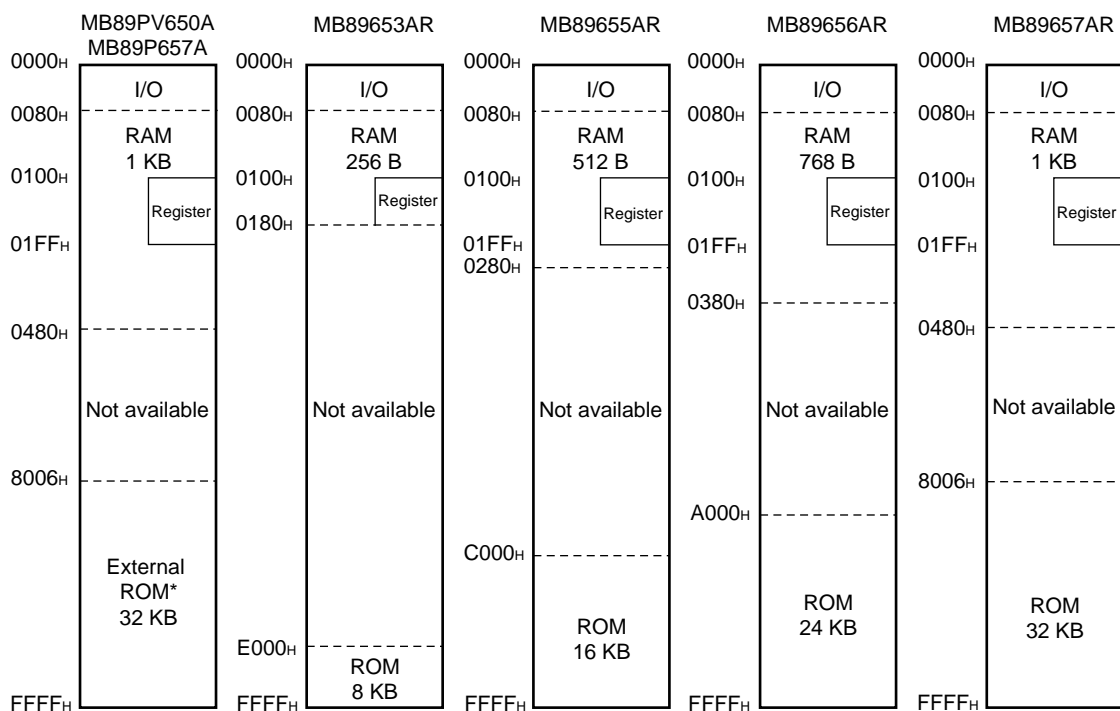

MB89650AR Series

■ CPU CORE

1. Memory Space

The microcontrollers of the MB89650AR series offer a memory space of 64 Kbytes for storing all of I/O, data, and program areas. The I/O area is located at the lowest address. The data area is provided immediately above the I/O area. The data area can be divided into register, stack, and direct areas according to the application. The program area is located at exactly the opposite end, that is, near the highest address. Provide the tables of interrupt reset vectors and vector call instructions toward the highest address within the program area. The memory space of the MB89650AR series is structured as illustrated below.

Memory Space

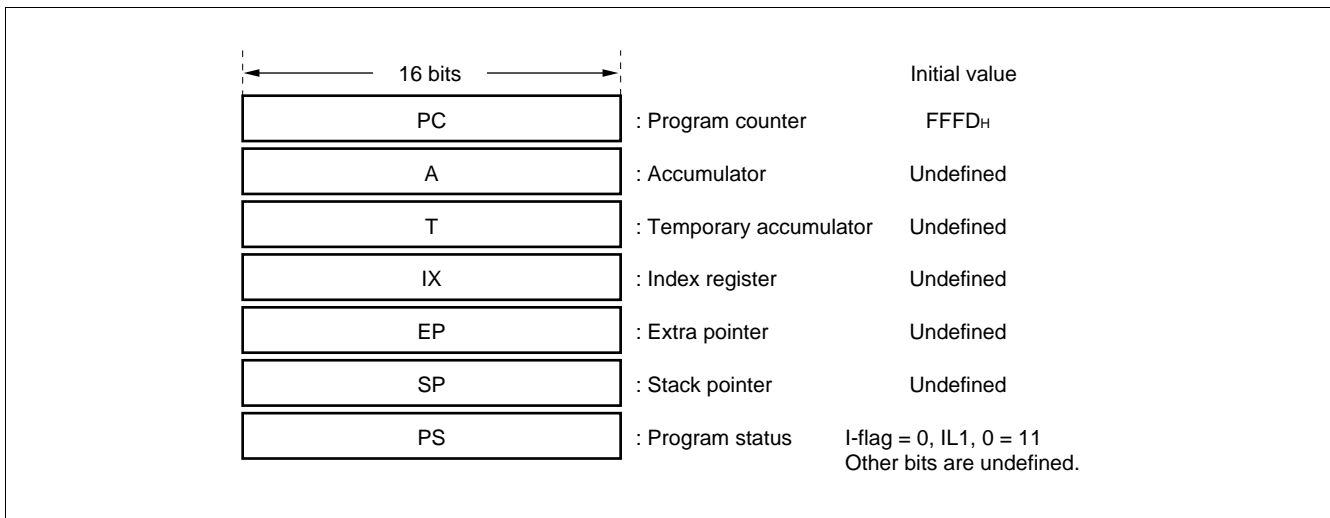

*: This is an internal PROM on the MB89P657A.

Since addresses 8000H to 8005H for the MB89P657A comprise an option area, do not use this area for the MB89PV650A.

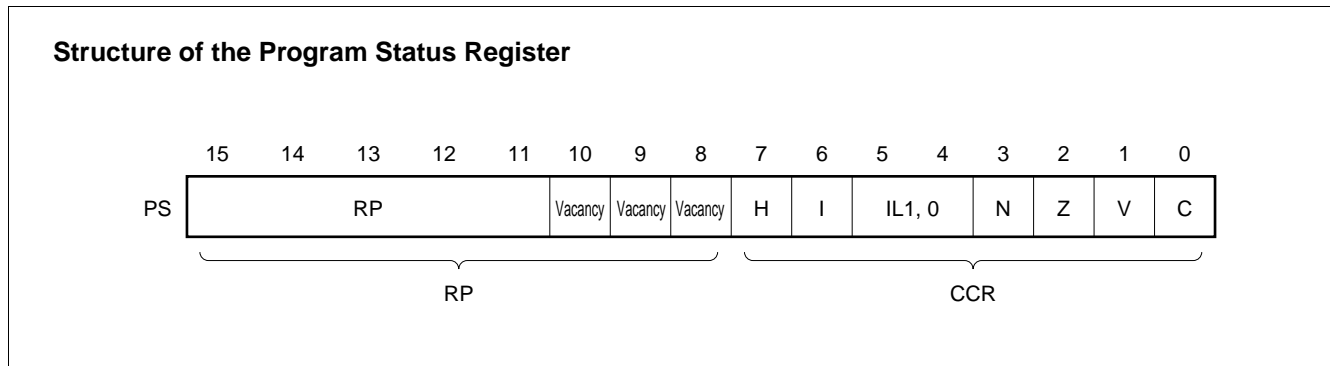

2. Registers

The F²MC-8L family has two types of registers; dedicated registers in the CPU and general-purpose registers in the memory. The following dedicated registers are provided:

- Program counter (PC): A 16-bit register for indicating instruction storage positions
- Accumulator (A): A 16-bit temporary register for storing arithmetic operations, etc. When the instruction is an 8-bit data processing instruction, the lower byte is used.
- Temporary accumulator (T): A 16-bit register which performs arithmetic operations with the accumulator. When the instruction is an 8-bit data processing instruction, the lower byte is used.
- Index register (IX): A 16-bit register for index modification
- Extra pointer (EP): A 16-bit pointer for indicating a memory address
- Stack pointer (SP): A 16-bit register for indicating a stack area
- Program status (PS): A 16-bit register for storing a register pointer, a condition code

The PS can further be divided into higher 8 bits for use as a register bank pointer (RP) and the lower 8 bits for use as a condition code register (CCR). (See the diagram below.)

MB89650AR Series

The RP indicates the address of the register bank currently in use. The relationship between the pointer contents and the actual address is based on the conversion rule illustrated below.

Rule for Conversion of Actual Addresses of the General-purpose Register Area

The CCR consists of bits indicating the results of arithmetic operations and the contents of transfer data and bits for control of CPU operations at the time of an interrupt.

- H-flag: Set when a carry or a borrow from bit 3 to bit 4 occurs as a result of an arithmetic operation. Cleared otherwise. This flag is for decimal adjustment instructions.
- I-flag: Interrupt is allowed when this flag is set to 1. Interrupt is prohibited when the flag is set to 0. Set to 0 when reset.
- IL1, 0: Indicates the level of the interrupt currently allowed. Processes an interrupt only if its request level is higher than the value indicated by this bit.

IL1	ILO	Interrupt level	High-low
0	0	1	High ↑ ↓ Low = no interrupt
0	1		
1	0	2	
1	1	3	

- N-flag: Set if the MSB is set to 1 as the result of an arithmetic operation. Cleared when the bit is set to 0.
- Z-flag: Set when an arithmetic operation results in 0. Cleared otherwise.
- V-flag: Set if the complement on 2 overflows as a result of an arithmetic operation. Reset if the overflow does not occur.
- C-flag: Set when a carry or a borrow from bit 7 occurs as a result of an arithmetic operation. Cleared otherwise. Set to the shift-out value in the case of a shift instruction.

The following general-purpose registers are provided:

General-purpose registers: An 8-bit register for storing data

The general-purpose registers are 8 bits and located in the register banks of the memory. One bank contains eight registers and up to a total of 16 banks can be used on the MB89653AR (RAM 256×8 bits). The bank currently in use is indicated by the register bank pointer (RP).

Note: The number of register banks that can be used varies with the RAM size. Up to a total of 32 banks can be used on other than the MB89653AR.

Register Bank Configuration

■ ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings

($AV_{SS} = V_{SS} = 0.0\text{ V}$)

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	V_{CC} AV_{CC}	$V_{SS} - 0.3$	$V_{SS} + 7.0$	V	*1
A/D converter reference input voltage	AVR	$V_{SS} - 0.3$	$V_{SS} + 7.0$	V	
LCD power supply voltage	V0 to V3	$V_{SS} - 0.3$	$V_{SS} + 7.0$	V	V0 to V3 must not exceed V_{CC} .
Input voltage	V_I	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	Except P70 to P75*2
	V_{I2}	$V_{SS} - 0.3$	$V_{SS} + 7.0$	V	P70 to P75
Output voltage	V_O	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	Except P70 to P75*2
	V_{O2}	$V_{SS} - 0.3$	$V_{SS} + 7.0$	V	P70 to P75
“L” level maximum output current	I_{OL}	—	20	mA	
“L” level average output current	I_{OLAV}	—	4	mA	Average value (operating current × operating rate)
“L” level total maximum output current	$\sum I_{OL}$	—	100	mA	
“L” level total average output current	$\sum I_{OLAV}$	—	40	mA	Average value (operating current × operating rate)
“H” level maximum output current	I_{OH}	—	-20	mA	
“H” level average output current	I_{OHAV}	—	-4	mA	Average value (operating current × operating rate)
“H” level total maximum output current	$\sum I_{OH}$	—	-50	mA	
“H” level total average output current	$\sum I_{OHAV}$	—	-20	mA	Average value (operating current × operating rate)
Power consumption	P_D	—	300	mW	
Operating temperature	T_A	-40	+85	°C	
Storage temperature	T_{stg}	-55	+150	°C	

*1: Use AV_{CC} and V_{CC} set at the same voltage.

Take care so that AVR does not exceed $AV_{CC} + 0.3\text{ V}$ and AV_{CC} does not exceed V_{CC} , such as when power is turned on.

*2: V_I and V_O must not exceed $V_{CC} + 0.3\text{ V}$.

Precautions: Permanent device damage may occur if the above “Absolute Maximum Ratings” are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

2. Recommended Operating Conditions

($V_{SS} = V_{SS} = 0.0\text{ V}$)

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	V_{CC} AV_{CC}	2.2*	6.0*	V	Normal operation assurance range* MB89653AR/655AR/656AR/657AR
		2.7*	6.0*	V	Normal operation assurance range* MB89PV650A/P657A
		1.5	6.0	V	Retains the RAM state in stop mode
A/D converter reference input voltage	AVR	0.0	AV_{CC}	V	
LCD power supply voltage	V0 to V3	V_{SS}	V_{CC}	V	LCD power supply range (The optimum value is dependent on the LCD element in use.)
Operating temperature	T_A	-40	+85	°C	

* : These values vary with the operating frequency, instruction cycle, and analog assurance range. See Figure 1 and "5. A/D Converter Electrical Characteristics."

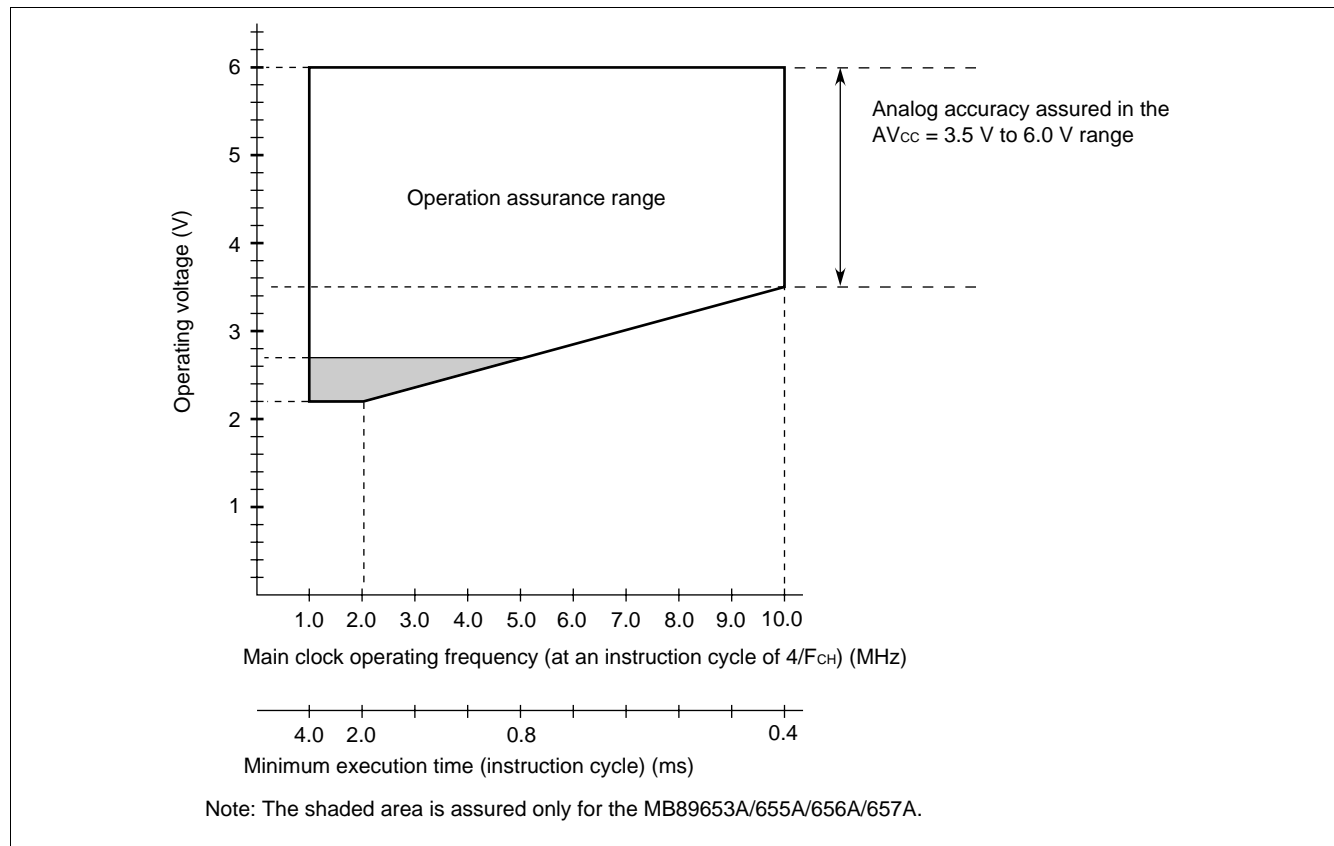

Figure 1 Operating Voltage vs. Main Clock Operating Frequency

Figure 1 indicates the operating frequency of the external oscillator at an instruction cycle of $4/F_{CH}$. Since the operating voltage range is dependent on the instruction cycle, see minimum execution time if the operating speed is switched using a gear.

MB89650AR Series

3. DC Characteristics

($V_{CC} = V_{CC} = 5.0\text{ V}$, $V_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$)

Parameter	Symbol	Pin	Condition	Value			Unit	Remarks
				Min.	Typ.	Max.		
“H” level input voltage	V_{IH1}	P20 to P26, P30 to P37, P40 to P47, P60 to P67, P80 to P83	—	$0.7 V_{CC}$	—	$V_{CC} + 0.3$	V	
	V_{IH2}	P72 to P75	—	$0.7 V_{CC}$	—	$V_{SS} + 6.0$	V	Without pull-up resistor
	V_{IHS}	P00 to P07, P10 to P17, \overline{RST} , MOD0, MOD1, P26 (at SC input)	—	$0.8 V_{CC}$	—	$V_{CC} + 0.3$	V	
	V_{IHS2}	P70, P71	—	$0.8 V_{CC}$	—	$V_{SS} + 6.0$	V	Without pull-up resistor
“L” level input voltage	V_{IL}	P20 to P26, P30 to P37, P40 to P47, P60 to P67, P72 to P75, P80 to P83	—	$V_{SS} - 0.3$	—	$0.3 V_{CC}$	V	
	V_{IS}	P00 to P07, P10 to P17, P26 (at SC input), P70, P71, \overline{RST} , MOD0, MOD1	—	$V_{SS} - 0.3$	—	$0.2 V_{CC}$	V	
Open-drain output pin application voltage	V_D	P24 to P26	—	$V_{SS} - 0.3$	—	$V_{SS} + 0.3$	V	N-ch open-drain
	V_{D2}	P70 to P75	—	$V_{SS} - 0.3$	—	$V_{SS} + 6.0$	V	
“H” level output voltage	V_{OH}	P00 to P07, P10 to P17, P20 to P26, P30 to P37, P40 to P47, P50 to P57, P80 to P83	$I_{OH} = -2.0\text{ mA}$	4.0	—	—	V

* : For information on t_{inst}, see "(4) Instruction Cycle" in "4. AC Characteristics."

(1) A/D Glossary

- Resolution

Analog changes that are identifiable with the A/D converter.

When the number of bits is 8, analog voltage can be divided into $2^8 = 256$.

- Linearity error (unit: LSB)

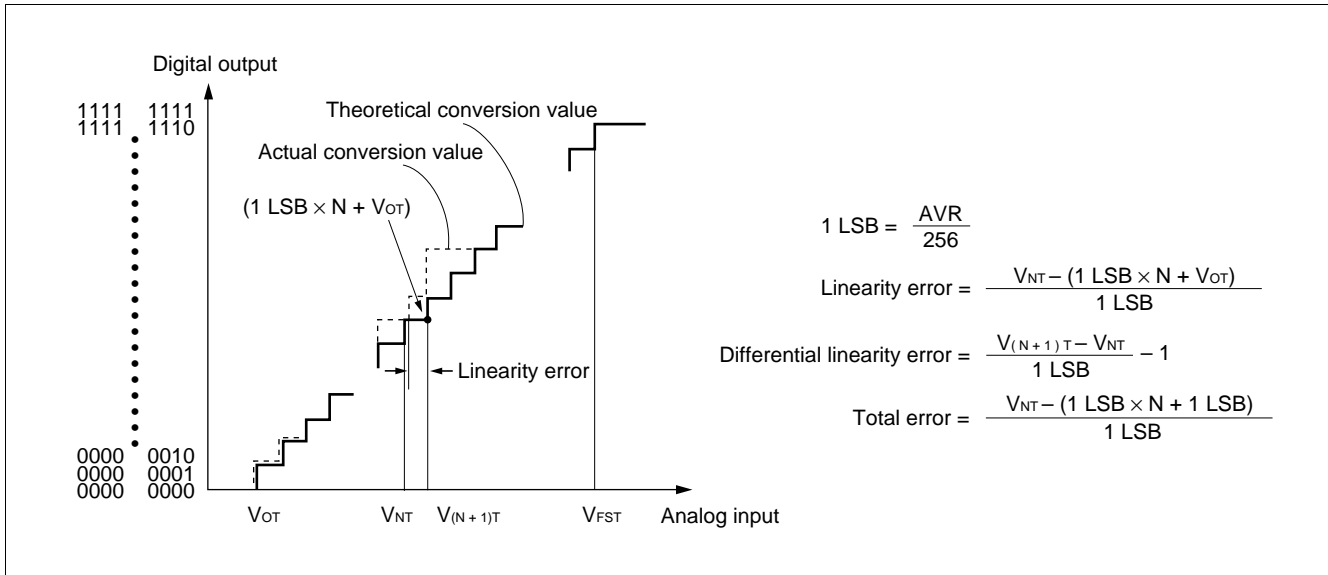

The deviation of the straight line connecting the zero transition point ("0000 0000" ↔ "0000 0001") with the full-scale transition point ("1111 1111" ↔ "1111 1110") from actual conversion characteristics

- Differential linearity error (unit: LSB)

The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

- Total error (unit: LSB)

The difference between theoretical and actual conversion values

(2) Precautions

• Input impedance of the analog input pins

The A/D converter used for the MB89650AR series contains a sample hold circuit as illustrated below to fetch analog input voltage into the sample hold capacitor for eight instruction cycles after activating A/D conversion.

For this reason, if the output impedance of the external circuit for the analog input is high, analog input voltage might not stabilize within the analog input sampling period. Therefore, it is recommended to keep the output impedance of the external circuit low (below 10 kΩ).

Note that if the impedance cannot be kept low, it is recommended to connect an external capacitor of about 0.1 μF for the analog input pin.

• Error

The smaller the $|AVR - AV_{SS}|$, the greater the error would become relatively.

MB89650AR Series

EXAMPLE CHARACTERISTICS

(1) "L" Level Output Voltage

(2) "H" Level Output Voltage

(3) "H" Level Input Voltage/"L" Level Input Voltage (CMOS Input)

(4) "H" Level Input Voltage/"L" Level Input Voltage (Hysteresis Input)

■ INSTRUCTIONS

Execution instructions can be divided into the following four groups:

- Transfer
- Arithmetic operation
- Branch
- Others

Table 1 lists symbols used for notation of instructions.

Table 1 Instruction Symbols

Symbol	Meaning
dir	Direct address (8 bits)
off	Offset (8 bits)
ext	Extended address (16 bits)
#vct	Vector table number (3 bits)
#d8	Immediate data (8 bits)
#d16	Immediate data (16 bits)
dir: b	Bit direct address (8:3 bits)
rel	Branch relative address (8 bits)
@	Register indirect (Example: @A, @IX, @EP)
A	Accumulator A (Whether its length is 8 or 16 bits is determined by the instruction in use.)
AH	Upper 8 bits of accumulator A (8 bits)
AL	Lower 8 bits of accumulator A (8 bits)
T	Temporary accumulator T (Whether its length is 8 or 16 bits is determined by the instruction in use.)
TH	Upper 8 bits of temporary accumulator T (8 bits)
TL	Lower 8 bits of temporary accumulator T (8 bits)
IX	Index register IX (16 bits)

(Continued)

MB89650AR Series

(Continued)

Symbol	Meaning
EP	Extra pointer EP (16 bits)
PC	Program counter PC (16 bits)
SP	Stack pointer SP (16 bits)
PS	Program status PS (16 bits)
dr	Accumulator A or index register IX (16 bits)
CCR	Condition code register CCR (8 bits)
RP	Register bank pointer RP (5 bits)
Ri	General-purpose register Ri (8 bits, i = 0 to 7)
×	Indicates that the very × is the immediate data. (Whether its length is 8 or 16 bits is determined by the instruction in use.)
(×)	Indicates that the contents of × is the target of accessing. (Whether its length is 8 or 16 bits is determined by the instruction in use.)
((×))	The address indicated by the contents of × is the target of accessing. (Whether its length is 8 or 16 bits is determined by the instruction in use.)

Columns indicate the following:

Mnemonic: Assembler notation of an instruction

~: Number of instructions

#: Number of bytes

Operation: Operation of an instruction

TL, TH, AH: A content change when each of the TL, TH, and AH instructions is executed. Symbols in the column indicate the following:

- “–” indicates no change.
- dH is the 8 upper bits of operation description data.
- AL and AH must become the contents of AL and AH immediately before the instruction is executed.
- 00 becomes 00.

N, Z, V, C: An instruction of which the corresponding flag will change. If + is written in this column, the relevant instruction will change its corresponding flag.

OP code: Code of an instruction. If an instruction is more than one code, it is written according to the following rule:

Example: 48 to 4F ← This indicates 48, 49, ... 4F.

Table 2 Transfer Instructions (48 instructions)

3	Selection of the oscillation stabilization time initial value { Crystal oscillator: $2^{18}/F_{CH}$ (Approx. 26.2 ms ⁻¹) Ceramic oscillator: $2^{13}/F_{CH}$ (Approx. 26.2 ms ⁻¹)	Selectable	$2^{18}/F_{CH}$ (Approx. 26.2 ms ⁻¹)	Fixed to $2^{18}/F_{CH}$ (Approx. 26.2 ms ⁻¹)
4	Selection either single- or dual-clock system { Single clock Dual clock	Selectable	Setting possible	Fixed to dual-clock system
5	Selection of a built-in booster*2 { Without booster With booster (Segment output switching) 16 segments: Selection of P30 to P37 and P40 to P47 20 segments: Selection of P30 to P37 and P40 to P43 24 segments: Selection of P30 to P37 28 segments: Selection of P30 to P33 32 segments: No port selection	Selectable	Can be selected from the following six options: -101: Without booster -102: 16 segments -103: 20 segments -104: 24 segments -105: 28 segments -106: 32 segments	Fixed to without booster

*1: The value at $F_{CH} = 10 \text{ MHz}$

*2: On microcontrollers with a built-in booster, only 1/3 bias can be used. The 1/2 duty cannot be used.

Note: Reset is input asynchronized with the internal clock whether with or without power-on reset.

MB89650AR Series

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The contents of this document may not be reproduced or copied without the permission of FUJITSU LIMITED.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipments, industrial, communications, and measurement equipments, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
