DESCRIPTION

The SY10/100EPT28L is a differential LVPECL-to-LVTTTL translator and a LVTTTL-to-differential LVPECL translator in a single package. Because LVPECL (Positive ECL) levels are used, only +3.3V and ground are required. The small outline 8-pin package and the dual translation design of the EPT28L makes it ideal for applications which are sending and receiving signals across a backplane.

The 100K series includes temperature compensation. Thus, logic levels are constant over temperature.

Figure 2. LVPECL Three-Resistor “Y-Termination”

Note 1. Power-saving alternative to 4-resistor, Thevenin termination.

Note 2. Place termination resistors as close to destination inputs as possible.

Note 3. R_b resistor sets the DC bias voltage, equal to V_t . For 3.3V supply, R_b value is between 46Ω to 50Ω.
