

### FEATURES

**Output frequency range:** 250 MHz to 4000 MHz  
**Modulation bandwidth:** 700 MHz (3 dB)  
**1 dB output compression:** 12 dBm @ 2140 MHz  
**Noise floor:** -158 dBm/Hz  
**Sideband Suppression:** < -40 dBc  
**LO Leakage:** < -40 dBm  
**Single supply:** 4.75 V to 5.5 V  
**24-Lead LFCSP package**

### APPLICATIONS

**Cellular/PCS communication systems infrastructure**  
**WCDMA/CDMA2000/GSM/EDGE, WiMax**  
**Wi-Max/broadband wireless access systems**

### PRODUCT DESCRIPTION

The F-MOD family of monolithic, RF quadrature modulators is designed for use from 250 MHz to 4000 MHz. Excellent phase accuracy and amplitude balance enable high performance direct RF modulation for communication systems.

The F-MOD family can be used as direct-to-RF modulators in digital communication systems such as GSM, CDMA, and WCDMA base stations, and QPSK or QAM broadband wireless access transmitters. A 700 MHz 3 dB baseband bandwidth makes it ideal in broadband Zero-IF or Low-IF-to-RF applications and in broadband Digital Pre-Distortion transmitters.

The F-MOD family is fabricated using Analog Devices' advanced Silicon-Germanium bipolar process, and are available in a 24-lead exposed-paddle LFCSP package. Performance is specified over a -40°C to +85°C temperature range.

## ABSOLUTE MAXIMUM RATINGS

Table 2. F-MOD Absolute Maximum Ratings

Parameter	Rating
Supply Voltage VPOS	5.5 V
IBBP, IBBN, QBBP, QBBN	0 V, 2.5 V
LOIP and LOIN	10 dBm
Internal Power Dissipation	800 mW
$\theta_{JA}$ (Exposed Paddle Soldered Down)	30°C/W
Maximum Junction Temperature	125°C
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-65°C to +150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

**PIN CONFIGURATION AND FUNCTIONAL DESCRIPTIONS**

Figure 2.

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1,2,7,10,11,12,21,22	COMM	Input Common Pins. Connect to ground plan via a low impedance path
3,4,5,6,14,15,16,17,18	VPS1,VPS2, VPS3,VPS4,VPS5	Positive Supply Voltage pins. All pins should be connected to the same supply. To ensure adequate external bypassing, connect 0.1 $\mu$ F capacitors between each pin and ground. Adjacent power supply pins of the same name can share one capacitor (see evaluation board schematic).
19,20,23,24	IBBP,IBBN, QBBN,QBBP	Differential In-Phase and Quadrature Baseband Inputs. These high impedance inputs must be dc-biased to approximately 500 mV dc, and must be driven from a low impedance source. Nominal characterized ac signal swing is 700 mV p-p on each pin. This results in a differential drive of 1.4 V p-p with a 500 mV dc bias. These inputs are not self-biased and must be externally biased.
8,9	LOIP, LOIN	50 $\Omega$ Single-Ended Local Oscillator Input. Internally dc-biased. Pins must be ac-coupled. AC-couple LOIN to ground and drive LO through LOIP.
13	VOUT	Device Output. Single-ended, 50 $\Omega$ internally biased RF output. Pin must be ac-coupled to the load.
	Exposed Paddle	Connect to ground plan via a low impedance path

## BASIC CONNECTIONS

Refer to the evaluation board schematic for the basic connections for operating the F-MOD family.

A single power supply of between 4.75 V and 5.5 V is applied to pins VPS1 and VPS2 and VPS3. All the VPS pins must be connected to the same potential. Adjacent pins of the same name can be tied together and decoupled with a 0.1 uF capacitor. These capacitors should be located as close as possible to the device.

All the COMM pins should be tied to the same ground plane through low impedance paths. The exposed paddle on the under side of the package should also be soldered to a low impedance ground plane. If multiple ground planes exist on the circuit board, these should be stitched together with multiple (typically 9) vias to enhance thermal and electrical

performance.

The baseband inputs QBBP, QBBN, IBBP and IBBN must be driven from a differential source. The nominal drive level of 1.4 Vpp differential (700 mVpp on each pin) should be biased at 500 mV.

A Single-ended Local Oscillator signal should be applied to the LOIP pin through an ac-coupling capacitor. The recommended LO drive power is 0 dBm. The LO return pin, LOIN, should be ac-coupled to ground through a low impedance path.

The RF output is available at the VOUT pin (Pin 7). This pin must also be ac-coupled. Both LOIP and VOUT have nominal broadband input and output impedances of 50 Ω and do not need further external matching.

Figure 5. F-MOD Evaluation Board Schematic.

### EVALUATION BOARD

Populated RoHS-compliant evaluation boards are available for the F-MOD family (see Ordering Guide for evaluation board part numbers). Each device has an exposed paddle underneath the package, which must be soldered to the board. The evaluation board is designed without any components on the underside of the board so that heat may be applied to the underside for easy removal and replacement of the F-MOD.

Note that the evaluation board pcb design includes an Enable Output SMA connector (ENOP) and switch (SW21) which connect ground or supply to pin 3. Since the F-MOD family does not support the Enable Output function (pin 3 is a power supply pin), SW21 should be placed in the ON position. This connects pin 3 to supply.
