TECHNICAL REFERENCE NOTES (TRN)

AA10C SERIES

DC-DC CONVERTER

ASTEC POWER

ANDOVER, MA

Electrical Specifications

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of the TRN. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Table 1. Absolute Maximum Ratings

Parameter	Device	Symbol	Min	Typ	Max	Unit
Input Voltage:						
Continuous:	All	V_I	0	-	80	Vdc
Transient (100ms)	All	$V_{I,trans}$	0	-	100	Vdc
Operating Case Temperature	All	T_C	-40	-	115	°C
Storage Temperature	All	T_{stg}	-55	-	125	°C
Operating Humidity	All	-	-	-	95	%
I/O Isolation	All	-	-	-	1500	Vdc

Input Specifications

Table 2. Input Specifications

Parameter	Device	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	All	V_I	36	48	75	Vdc
Maximum Input Current ($V_I = 0$ to $V_{I,max}$; $I_O = I_{O,max}$)	015S-X 020S-X 025S-X* 033S-X 050S-X 120S-X 150S-X	$I_{I,max}$ $I_{I,max}$ $I_{I,max}$ $I_{I,max}$ $I_{I,max}$ $I_{I,max}$ $I_{I,max}$	- - - - - - -	- - - - - - -	0.15 0.18 0.22 0.30 0.40 0.37 0.37	A A A A A A A

Test Configurations

Note: Measure input reflected-ripple current with a simulated source inductance (L_{test}) of 12 μ H. Capacitor C_s offsets possible battery impedance. Measure current as shown above.

Figure 12. Input Reflected-ripple Test Setup.

Note: Use a 2 x 0.47 uF ceramic capacitors. Scope measurement should be made using a BNC socket. Position the load between 51 mm and 76 mm (2 in. and 3 in.) from module.

Figure 13. Peak-to-Peak Output Noise Measurement Test Setup.

Feature Descriptions

Output Overvoltage Clamp

The output overvoltage clamp consists of a separate control loop, independent of the primary control loop. This control loop has a higher voltage setpoint than the primary loop. In a fault condition the converter goes into “Hiccup Mode”, and the output overvoltage clamp ensures that the output voltage does not exceed $V_{o,clamp,max}$. This secondary control loop provides a redundant voltage-control that reduces the risk of output overvoltage.

Output Current Protection

To provide protection in an output overload or short circuit condition, the converter is equipped with current limiting circuitry and can endure the fault condition for an unlimited duration. At the point of current-limit inception, the converter goes into “Hiccup Mode”, causing the output current to be limited both in peak and duration. The converter operates normally once the output current is brought back into its specified range.

Enable (Optional)

Two enable option are available. Positive Logic Enable, suffix “4”, and Negative Logic Enable, suffix “1”. Positive Logic Enable turns the converter on during a logic-high voltage on the enable pin, and off during a logic-low. Negative Logic Enable turns the converter of during a logic-high and on during a logic-low.

Output Voltage Adjustment (Optional)

Output voltage adjustment is accomplished by connecting an external resistor between the V_{adj} Pin and either the +Vout or –Vout Pins.

With an external resistor between the V_{adj} Pin and +Vout Pin ($R_{adj-down}$) the output voltage set point ($V_{o,adj}$) decreases (see Figure 14). The following equation determines the required external resistor value to obtain an adjusted output voltage:

Feature Descriptions (continued)

$$R_{adj_down} = \left[\frac{(V_{o,adj} - L) \cdot G}{(V_{o,nom} - V_{o,adj})} - H \right] \cdot \text{ohm}$$

Where R_{adj_down} is the resistance value and G, H, and L are defined in Table 7.

With an external resistor between the V_{adj} Pin and $-V_{out}$ Pin (R_{adj_up}) the output voltage set point ($V_{o,adj}$) increases (see Figure 15). The following equation determines the required external resistor value to obtain an adjusted output voltage:

$$R_{adj_up} = \left[\frac{G \cdot L}{((V_{o,adj} - L) - K)} - H \right] \cdot \text{ohm}$$

Where R_{adj_up} is the resistance value and G, H, K, and L are defined in Table 7:

Table 7 Output Adjustment Variables.

Model	G	H	K	L
015S	5110	2050	0.26	1.24
020S	5110	2050	0.76	1.24
033S	5110	2050	0.80	2.5
050S	5110	2050	2.5	2.5
120S	10,000	5110	9.5	2.5
150S	10,000	5110	12.5	2.5

Figure 14 . Circuit Configuration to Decrease Output Voltage.

Figure 15 . Circuit Configuration to Increase Output Voltage.

Thermal Considerations

The power converter operates in a variety of thermal environments: however, sufficient cooling should be provided to help ensure reliable operation of the converter. Heat-dissipating components are thermally coupled to the PCB. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the PCB temperature. See figure 23 for PCB temperature measurement location.

Heat Transfer Characteristics

Increasing airflow over the converter enhances the heat transfer via convection. Figure 16 shows the maximum power that can be dissipated by the converter without exceeding the maximum case temperature versus local ambient temperature (T_A) for natural convection through 3.0 m/s (600 ft/min).

Systems in which these converters are used generate airflow rates of 0.25 m/s (50 ft/min) due to other heat dissipating components in the system. Therefore, the natural convection condition represents airflow rates of approximately 0.25 m/s (50 ft/min). Use of Figure 16 is shown in the following example.

Example

What is the minimum airflow required for an 050S operating at 48 V, an output current of 2.0 A, and maximum ambient temperature of 95 °C.

Solution:

Given: $V_i = 48$ V, $I_o = 3.0$ A, $T_A = 95$ °C.

Determine P_D (Figure 20): $P_D = 2.2$ W.

Determine airflow (Figure 16): $v = 1.0$ m/s (200 ft/min)
