HYS64V16220GDL

#### 144 pin SO-DIMM SDRAM Modules PC100 / PC133 128 MB density Target Datasheet

- 144 Pin Eight Byte Small Outline Dual-In-Line Synchronous DRAM Modules for PC 100 and PC133 notebook applications
- two bank 16M x 64 non-parity module organisation
- Performance:

		-7.5	-8	
		PC133 3-3-3	PC100 2-2-2	Units
f <sub>CK</sub>	Clock frequency (max.)	133	100	MHz
t <sub>AC</sub>	Clock access time CAS latency = 2 & 3	5.4	6	ns

- Single +3.3V(± 0.3V ) power supply
- Programmable  $\overline{\text{CAS}}$  Latency, Burst Length and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- Decoupling capacitors mounted on substrate
- All inputs, outputs are LVTTTL compatible
- Serial Presence Detect with E<sup>2</sup>PROM
- Uses 8M x 16 128Mbit SDRAM components
- 4096 refresh cycles every 64 ms
- Gold contact pad
- This module family is fully compliant with the latest INTEL SO-DIMM layout specification

This INFINEON module is an industry standard 144 pin 8-byte Synchronous DRAM (SDRAM) Small Outline Dual In-line Memory Modules (SO-DIMM) which is organised as 16x64 high speed memory arrays designed for use in non-parity applications. These SO-DIMMs use SDRAMs in TSOPII packages. Decoupling capacitors are mounted on the board.

The DIMMs use optional serial presence detects implemented via a serial E<sup>2</sup>PROM using the two pin I<sup>2</sup>C protocol. The first 128 bytes are utilized by the DIMM manufacturer and the second 128 bytes are available to the end user.

All INFINEON 144-pin SO-DIMMs provide a high performance, flexible 8-byte interface in a 67,5 mm long footprint.

**Product Spectrum:**

		SDRAMs used	RowAddr.	Bank Select	Column Addr.	Refresh	Period
16M x 64	HYS64V16220GDL-7.5	8 8Mx16	12	BA0, BA1	9	4k	64 ms

**Notes:**

1. These parameters depend on the cycle rate. These values are measured at 133 MHz for -7.5 and 100 MHz for -8 modules. Input signals are changed once during tck, excepts for ICC6 and for standby currents when tck=infinity.
2. These parameters are measured with continuous data stream during read access and all DQ toggling. CL=3 and BL=4 is assumed and the VDDQ current is excluded.

DQM Write Mask Latency	$t_{DQW}$	0	–	0	–	CLK	

**Notes:**

1. An initial pause of 100 $\mu$ s is required after power-up, then a Precharge All Banks command must be given followed by 8 Auto Refresh (CBR) cycles before the Mode Register Set Operation can begin.
2. AC timing tests have  $V_{il} = 0.4$  V and  $V_{ih} = 2.4$  V with the timing referenced to the 1.4 V crossover point. The transition time is measured between  $V_{ih}$  and  $V_{il}$ . All AC measurements assume  $t_T = 1$  ns with the AC output load circuit shown. Specified  $t_{ac}$  and  $t_{oh}$  parameters are measured with a 50 pF only, without any resistive termination and with a input signal of 1V / ns edge rate between 0.8V and 2.0 V

3. If clock rising time is longer than 1 ns, a time ( $t_T - 0.5$ ) ns has to be added to this parameter.
4. If  $t_T$  is longer than 1 ns, a time ( $t_T - 1$ ) ns has to be added to this parameter.
5. Any time that the refresh Period has been exceeded, a minimum of two Auto (CRB) Refresh commands must be given to “wake-up” the device.
6. Self Refresh Exit is a synchronous operation and begins on the 2nd positive clock edge after CKE returns high. Self Refresh Exit is not complete until a time period equal to  $t_{RC}$  is satisfied once the Self Refresh Exit command is registered.
7. Referenced to the time which the output achieves the open circuit condition, not to output voltage levels.

### Serial Presence Detects:

A serial presence detect storage device - E<sup>2</sup>PROM - is assembled onto the module. Information about the module configuration, speed, etc. is written into the E<sup>2</sup>PROM device during module production using a serial presence detect protocol ( I<sup>2</sup>C synchronous 2-wire bus)
