DESCRIPTION

The GAL20V8/883 is a high performance E²CMOS programmable logic devices processed in full compliance to MIL-STD-883. This military grade device combines a high performance CMOS process with Electrically Erasable (E²) floating gate technology to provide the highest speed/power performance available in the 883 qualified PLD market.

The generic GAL architecture provides maximum design flexibility by allowing the Output Logic Macrocell (OLMC) to be configured by the user. The GAL20V8/883 is capable of emulating all standard 24-pin PAL® devices with full function/fuse map/parametric compatibility.

Unique test circuitry and reprogrammable cells allow complete AC, DC, and functional testing during manufacture. Therefore, Lattice Semiconductor delivers 100% field programmability and functionality of all GAL products. In addition, 100 erase/write cycles and data retention in excess of 20 years are specified.

fmax DESCRIPTIONS

Note: fmax with external feedback is calculated from measured tsu and tco.

Note: fmax with no feedback may be less than $1/(t_{wh} + t_{wl})$. This is to allow for a clock duty cycle of other than 50%.

Note: tcf is a calculated value, derived by subtracting tsu from the period of fmax w/internal feedback ($t_{cf} = 1/f_{max} - t_{su}$). The value of tcf is used primarily when calculating the delay from clocking a register to a combinational output (through registered feedback), as shown above. For example, the timing from clock to a combinational output is equal to $t_{cf} + t_{pd}$.
