Dual 3A 1MHz/2.5MHz High Efficiency Synchronous Buck Regulator

ISL8036, ISL8036A

ISL8036, ISL8036A are integrated power controllers rated for dual 3A output current or current sharing operation with a 1MHz (ISL8036)/2.5MHz (ISL8036A) step-down regulator, which is ideal for any low power low-voltage applications. The channels are 180° out-of-phase for input RMS current and EMI reduction. It is optimized for generating low output voltages down to 0.8V each. The supply voltage range is from 2.8V to 6V, allowing for the use of a single Li+ cell, three NiMH cells or a regulated 5V input. The two channels are 180 degrees out of phase, and each one has a guaranteed minimum output current of 3A. They can be combined to form a single 6A output in the current sharing mode. While in current sharing, the interleaved PWM signals reduce input and output ripple.

The ISL8036, ISL8036A includes a pair of low ON-resistance P-channel and N-channel internal MOSFETs to maximize efficiency and minimize external component count. 100% duty-cycle operation allows less than 250mV dropout voltage at 3A each.

The ISL8036, ISL8036A offers an independent 1ms Power-good (PG) timer at power-up. When shutdown, ISL8036, ISL8036A discharges the output capacitor. Other features include internal digital soft-start, enable for power sequence, overcurrent protection, and thermal shutdown.

The ISL8036, ISL8036A is offered in a 24 Ld 4mmx4mm QFN package with 1mm maximum height. The complete converter occupies less than 1.5cm^2 area.

Features

- 3A High Efficiency Synchronous Buck Regulator with up to 95% Efficiency
- 2% Output Accuracy Over-Temperature/Load/Line
- Internal Digital Soft-Start - 1.5ms
- 6A Current Sharing Mode Operation
- External Synchronization up to 6MHz
- Internal Current Mode Compensation
- Peak Current Limiting and Hiccup Mode Short Circuit Protection
- Reverse Overcurrent Protection

Applications* (see page 24)

- DC/DC POL Modules
- µC/µP, FPGA and DSP Power
- Plug-in DC/DC Modules for Routers and Switchers
- Test and Measurement Systems
- Li-ion Battery Power Devices
- Bar Code Reader

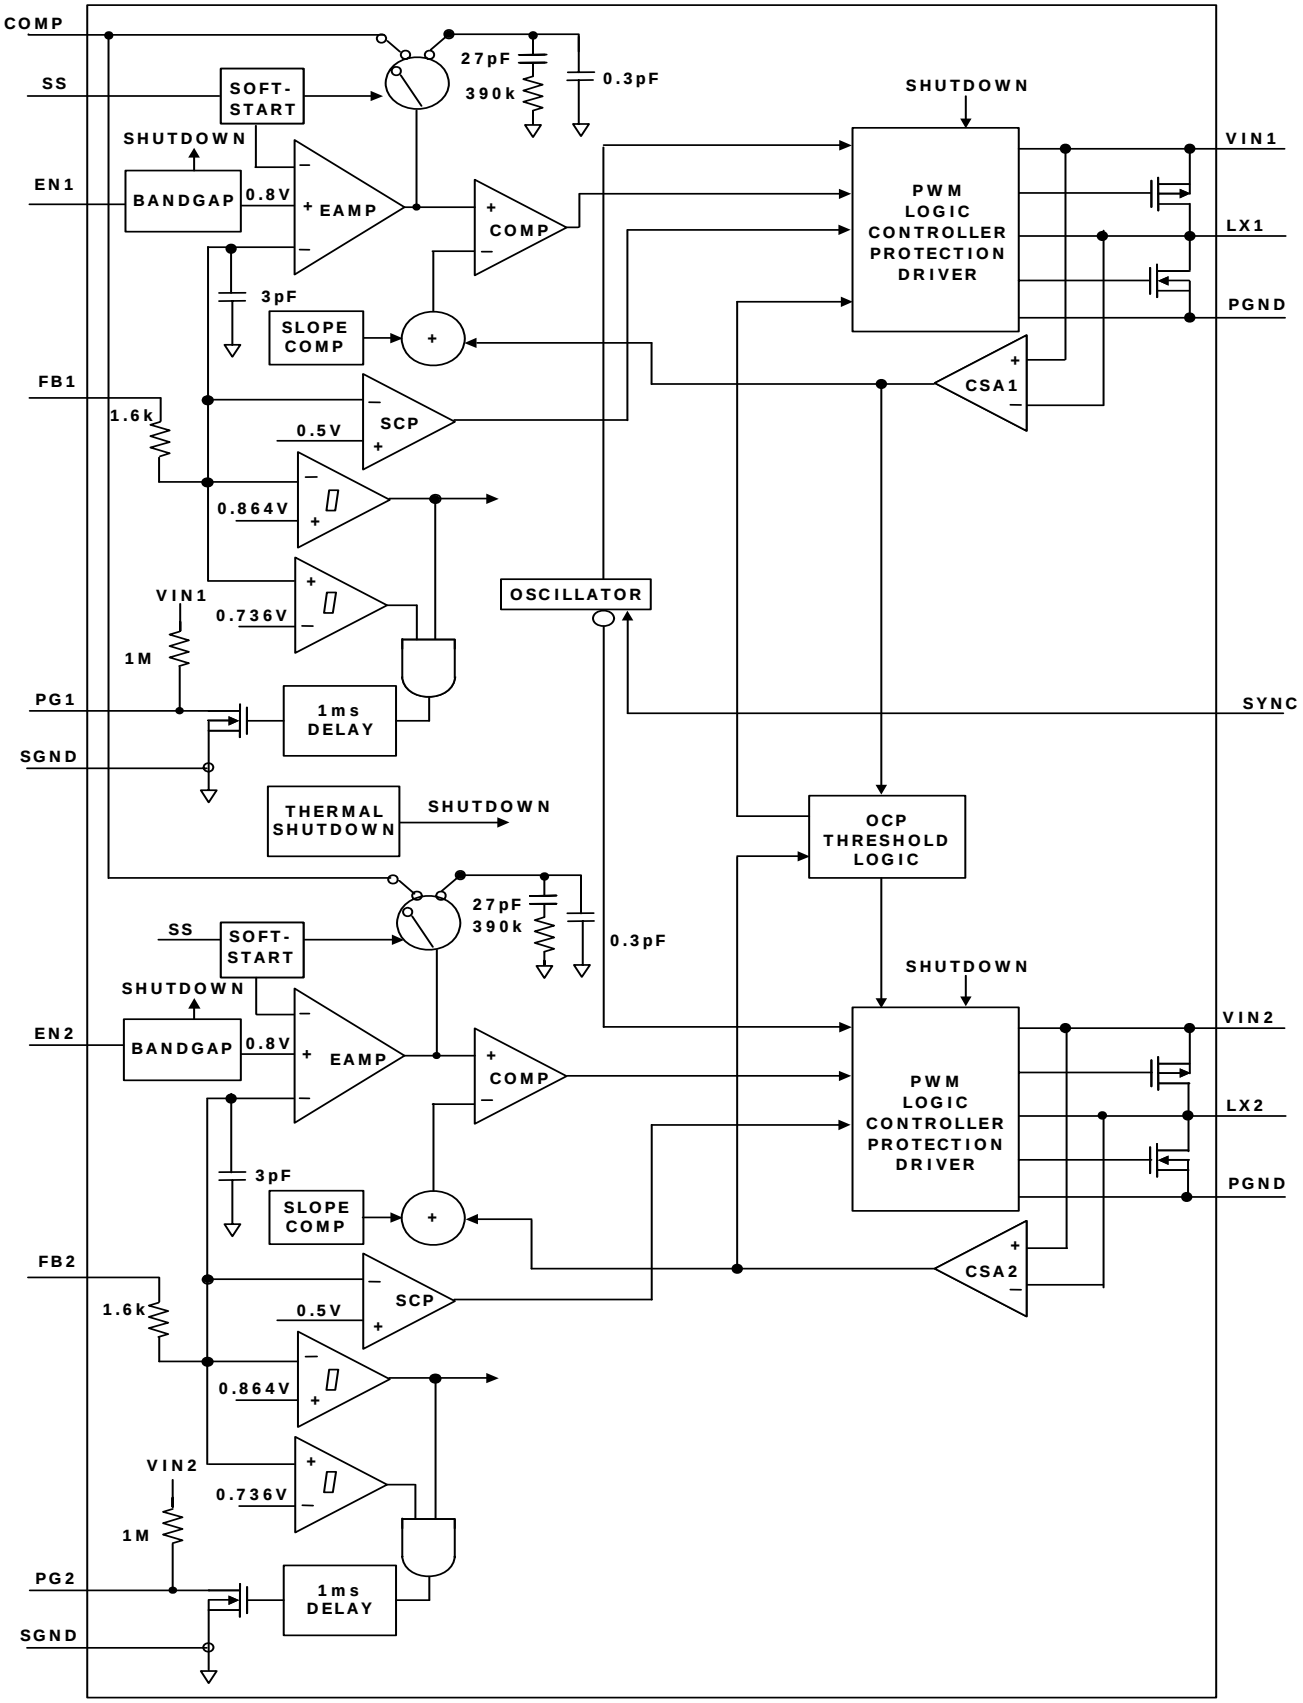
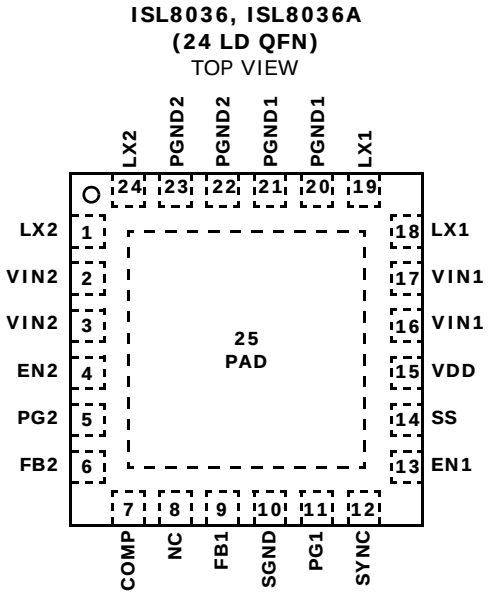
ISL8036A	Internally fixed switching frequency F_{SW} = 2.5MHz

Block Diagram



Pin Configuration



Pin Descriptions

PIN NUMBER	SYMBOL	DESCRIPTION
1, 24	LX2	Switching node connection for Channel 2. Connect to one terminal of inductor for VOUT2.
22, 23	PGND2	Negative supply for the power stage of Channel 2.
4	EN2	Regulator Channel 2 enable pin. Enable the output, VOUT2, when driven to high. Shutdown the VOUT2 and discharge output capacitor when driven to low. Do not leave this pin floating.
5	PG2	1ms timer output. At power-up or EN HI, this output is a 1ms delayed Power-Good signal for the VOUT2 voltage.
6	FB2	The feedback network of the Channel 2 regulator. To be connected to FB1 (current sharing)
7	COMP	An additional external network across COMP and SGND is required to improve the loop compensation of the amplifier channel parallel operation. The soft-start pin should be tied to the external capacitor.
8	NC	No connect pin; please tie to GND.
9	FB1	The feedback network of the Channel 1 regulator. FB1 is the negative input to the transconductance error amplifier. The output voltage is set by an external resistor divider connected to FB1. With a properly selected divider, the output voltage can be set to any voltage between the power rail (reduced by converter losses) and the 0.8V reference. There is an internal compensation to meet a typical application. In addition, the regulator power-good and undervoltage protection circuitry use FB1 to monitor the Channel 1 regulator output voltage.
10	SGND	System ground.
11	PG1	1ms timer output. At power-up or EN HI, this output is a 1ms delayed Power-Good signal for the VOUT1 voltage.
12	SYNC	Connect to logic high or input voltage VIN . Connect to an external function generator for external Synchronization. Negative edge trigger. Do not leave this pin floating. **Do not tie this pin low (or to SGND).**
13	EN1	Regulator Channel 1 enable pin. Enable the output, VOUT1, when driven to high. Shutdown the VOUT1 and discharge output capacitor when driven to low. Do not leave this pin floating.

Pin Descriptions (Continued)

PIN NUMBER	SYMBOL	DESCRIPTION
14	SS	SS is used to adjust the soft-start time. Connect a capacitor from SS to SGND to adjust the soft-start time (current sharing). C_{SS} should not be larger than 33nF. This capacitor, along with an internal 5µA current source sets the soft-start interval of the converter, t_{SS}. $C_{SS}[\mu F] = 6.25 \cdot t_{SS}[s]$ (EQ. 1)
15	VDD	Input supply voltage for the logic. VDD to be at the same potential as VIN +0.3/-0.5V.
20, 21	PGND1	Negative supply for the power stage of Channel 1.
18, 19	LX1	Switching node connection for Channel 1. Connect to one terminal of inductor for VOUT1.
16, 17 2, 3	VIN1, VIN2	Input supply voltage. Connect 22µF ceramic capacitor to power ground per channel.
25	PAD	The exposed pad must be connected to the SGND pin for proper electrical performance. Add as much vias as possible for optimal thermal performance.

Ordering Information

PART NUMBER (Notes 2, 3)	PART MARKING	TEMP. RANGE (°C)	PACKAGE (Pb-free)	PKG. DWG. #
ISL8036IRZ	80 36IRZ	-40 to +85	24 Ld 4x4 QFN	L24.4x4D
ISL8036IRZ-T (Note 1)	80 36IRZ	-40 to +85	24 Ld 4x4 QFN	L24.4x4D
ISL8036AIRZ	80 36AIRZ	-40 to +85	24 Ld 4x4 QFN	L24.4x4D
ISL8036AIRZ-T (Note 1)	80 36AIRZ	-40 to +85	24 Ld 4x4 QFN	L24.4x4D

NOTES:

1. Please refer to TB347 for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for ISL8036, ISL8036A. For more information on MSL, please see Technical Brief TB363.

Table of Contents

Absolute Maximum Ratings (Reference to SGND)

VIN1,VIN2, VDD. . . . . -0.3V to 6.5V (DC) or 7V (20ms)
LX1, LX2. . . -1.5V (100ns)/-0.3V (DC) to 6.5V (DC) or 7V (20ms)
EN1, EN2, PG1, PG2, SYNC, SS . . . . . -0.3V to +6.5V
FB1, FB2, COMP. . . . . -0.3V to 2.7V
NC . . . . . -0.3V to 0.3V
ESD Ratings
Human Body Model (Tested per JESD22-A114) 4kV
Charged Device Model (Tested per JESD22-C101E) . . . 2kV
Machine Model (Tested per JESD22-A115) 300V
Latch Up (Tested per JESD-78A; Class 2, Level A) . . . 100mA

Thermal Information

Thermal Resistance (Typical)	θ_{JA} (°C/W)	θ_{JC} (°C/W)
24 Ld 4x4 QFN (Notes 4, 5)	36	2

Junction Temperature Range . . . . . -55°C to +150°C
Storage Temperature Range . . . . . -65°C to +150°C
Ambient Temperature Range . . . . . -40°C to +85°C
Pb-Free Reflow Profile . . . . . .see link below
http://www.intersil.com/pbfree/Pb-FreeReflow.asp

Recommended Operating Conditions

VIN Supply Voltage Range . . . . . 2.85V to 6V
Load Current Range per Channel. . . . . 0A to 3A
Ambient Temperature Range . . . . . -40°C to +85°C

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

4. θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with “direct attach” features. See Tech Brief TB379.
5. For θ_{JC}, “case temperature” location is at the center of the exposed metal pad on the package underside.

Electrical Specifications

Unless otherwise noted, the typical specifications are measured at the following conditions: T_A = -40°C to +85°C, V_{IN} = 3.6V, EN1 = EN2 = VDD, L = 1.5µH, C1 = C2 = C4 = 2x22µF, I_{OUT1} = I_{OUT2} = 0A to 3A, unless otherwise noted. Typical values are at T_A = +25°C. **Boldface limits apply over the operating temperature range, -40°C to +85°C.**

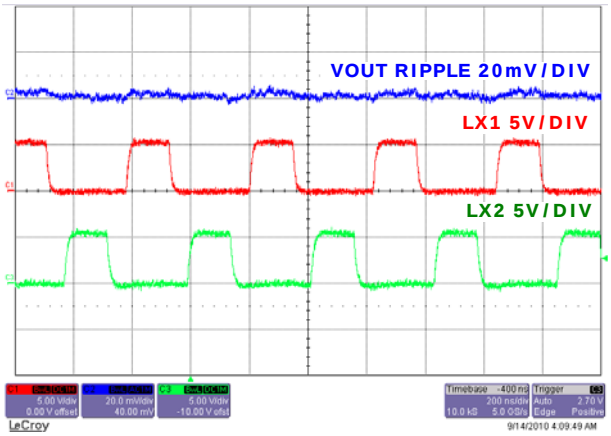

FIGURE 64. STEADY STATE OPERATION AT NO LOAD

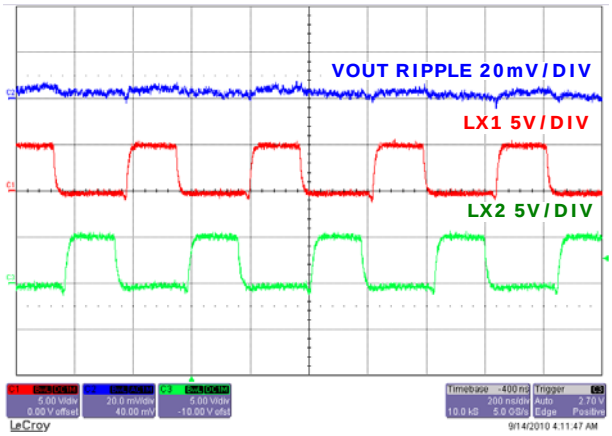

FIGURE 65. STEADY STATE OPERATION AT FULL 6A LOAD

Theory of Operation

The ISL8036, ISL8036A is a dual 3A or current sharing 6A step-down switching regulator optimized for battery-powered or mobile applications. The regulator operates at 1MHz (ISL8036) or 2.5MHz (ISL8036A) fixed switching frequency under heavy load condition. The two channels are 180° out-of-phase operation. The supply current is typically only 8µA when the regulator is shutdown.

PWM Control Scheme

Pulling the SYNC pin HI (>1.5V) forces the converter into PWM mode in the next switching cycle regardless of output current. Each of the channels of the ISL8036, ISL8036A employ the current-mode pulse-width modulation (PWM) control scheme for fast transient response and pulse-by-pulse current limiting, as shown in the "Block Diagram" on page 4 with waveforms in Figure 66. The current loop consists of the oscillator, the PWM comparator COMP, current sensing circuit, and the slope compensation for the current loop stability. The current sensing circuit consists of the resistance of the P-channel MOSFET when it is turned on and the current sense amplifier CSA1. The gain for the current sensing circuit is typically 0.2V/A. The control reference for the current loops comes from the error amplifier EAMP of the voltage loop.

The PWM operation is initialized by the clock from the oscillator. The P-channel MOSFET is turned on at the beginning of a PWM cycle and the current in the MOSFET starts to ramp up. When the sum of the current amplifier CSA1 (or CSA2 on Channel 2) and the compensation slope (0.46V/µs) reaches the control reference of the current loop, the PWM comparator COMP sends a signal to the PWM logic to turn off the P-MOSFET and to turn on the N-channel MOSFET. The N-MOSFET stays on until the end of the PWM cycle. Figure 66 shows the typical operating waveforms during the PWM operation. The dotted lines illustrate the sum of the compensation ramp and the current-sense amplifier CSA_ output.

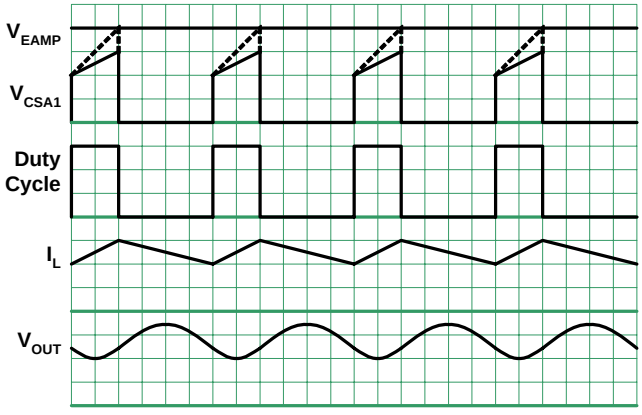

FIGURE 66. PWM OPERATION WAVEFORMS

The output voltage is regulated by controlling the reference voltage to the current loop. The bandgap circuit outputs a 0.8V reference voltage to the voltage control loop. The feedback signal comes from the VFB pin. The soft-start block only affects the operation during the start-up and will be discussed separately. The error amplifier is a transconductance amplifier that converts the voltage error signal to a current output. The voltage loop is internally compensated with the 27pF and 390kΩ RC network. The maximum EAMP voltage output is precisely clamped to the bandgap voltage (1.172V).

Synchronization Control

The frequency of operation can be synchronized up to 6MHz by an external signal applied to the SYNC pin. The 1st falling edge on the SYNC triggered the rising edge of the PWM ON pulse of Channel 1. The 2nd falling edge of the SYNC triggers the rising edge of the PWM ON pulse of the Channel 2. This process alternate indefinitely allowing 180° output phase operation between the two channels.

Output Current Sharing

The ISL8036, ISL8036A dual outputs are paralleled for multi-phase operation in order to support a 6A output. Connect the FBs together and connect all the COMPs together. Channel 1 and Channel 2 will be 180° out-of-phase. In parallel configuration, external soft-start should be used to ensure proper full loading start-up. Before using full load in current sharing mode, PWM mode should be enabled. Likewise, multiple regulators can be paralleled by connecting the FBs, COMPs, and SS for higher current capability. External compensation is required.

Overcurrent Protection

CAS1 and CSA2 are used to monitor Output 1 and Output 2 channels respectively. The overcurrent protection is realized by monitoring the CSA output with the OCP threshold logic, as shown in Figure 66. The current sensing circuit has a gain of 0.2V/A, from the P-MOSFET current to the CSA_ output. When the CSA1 output reaches the threshold, the OCP comparator is tripped to turn off the P-MOSFET immediately. The overcurrent function protects the switching converter from a shorted output by monitoring the current flowing through the upper MOSFETs.

Upon detection of overcurrent condition, the upper MOSFET will be immediately turned off and will not be turned on again until the next switching cycle. Upon detection of the initial overcurrent condition, the Overcurrent Fault Counter is set to 1 and the Overcurrent Condition Flag is set from LOW to HIGH. If, on the subsequent cycle, another overcurrent condition is detected, the OC Fault Counter will be incremented. If there are 17 sequential OC fault detections, the regulator will be shutdown under an Overcurrent Fault Condition. An Overcurrent Fault Condition will result with the regulator attempting to restart in a hiccup mode with the delay between restarts being 4 soft-start periods. At the end of the fourth soft-start wait period, the fault counters

are reset and soft-start is attempted again. If the overcurrent condition goes away prior to the OC Fault Counter reaching a count of four, the Overcurrent Condition Flag will set back to LOW.

If the negative output current reaches -2.5A, the part enters Negative Overcurrent Protection. At this point, all switching stops and the part enters tri-state mode while the pull-down FET is discharging the output until it reaches normal regulation voltage, then the IC restarts.

PG

There are two independent power-good signals. PG1 monitors the Output Channel 1 and PG2 monitors the Output Channel 2. When powering up, the open-collector Power-on Reset output holds low for about 1ms after V_O reaches the preset voltage. The PG_ output also serves as a 1ms delayed Power-Good signal.

UVLO

When the input voltage is below the undervoltage lock out (UVLO) threshold, the regulator is disabled.

Enable

The enable (EN) input allows the user to control the turning on or off the regulator for purposes such as power-up sequencing. When the regulator is enabled, there is typically a 600µs delay for waking up the bandgap reference. Then the soft start-up begins.

Soft-start-up

The soft-start-up eliminates the inrush current during the start-up. The soft-start block outputs a ramp reference to both the voltage loop and the current loop. The two ramps limit the inductor current rising speed as well as the output voltage speed so that the output voltage rises in a controlled fashion. At the very beginning of the start-up, the output voltage is less than 0.5V; hence the PWM operating frequency is 1/2 of the normal frequency.

When the IC ramps up at start-up, it can't sink current even at PWM mode, behaving like in diode emulated mode for the soft-start time.

Discharge Mode (Soft-Stop)

When a transition to shutdown mode occurs, or the output undervoltage fault latch is set, its output discharges to PGND through an internal 100Ω switch.

Power MOSFETs

The power MOSFETs are optimize for best efficiency. The ON -resistance for the P-MOSFET is typically 50mΩ and the ON-resistance for the N-MOSFET is typical 50mΩ.

100% Duty Cycle

The ISL8036, ISL8036A features 100% duty cycle operation to maximize the battery life. When the battery voltage drops to a level that the ISL8036, ISL8036A can no longer maintain the regulation at the output, the regulator completely turns on the P-MOSFET. The maximum drop-out voltage under the 100% duty-cycle operation is the product of the load current and the ON-resistance of the P-MOSFET.

Thermal Shutdown

The ISL8036, ISL8036A has built-in thermal protection. When the internal temperature reaches +150°C, the regulator is completely shutdown. As the temperature drops to +125°C, the ISL8036, ISL8036A resumes operation by stepping through a soft start-up.

Applications Information

Output Inductor and Capacitor Selection

To consider steady state and transient operation, ISL8036, ISL8036A typically uses a 1.5µH output inductor. Higher or lower inductor value can be used to optimize the total converter system performance. For example, for a higher output voltage 3.3V application, in order to decrease the inductor current ripple and output voltage ripple, the output inductor value can be increased. The inductor ripple current can be expressed in Equation 2:

$$\Delta I = \frac{V_O \bullet \left(1 - \frac{V_O}{V_{IN}}\right)}{L \bullet f_S} \quad \text{(EQ. 2)}$$

The inductor's saturation current rating needs be at least larger than the peak current. The ISL8036, ISL8036A protects the typical peak current 4.8A. The saturation current needs be over 4.8A for maximum output current application.

ISL8036, ISL8036A uses an internal compensation network and the output capacitor value is dependent on the output voltage. The ceramic capacitor is recommended to be X5R or X7R. The recommended minimum output capacitor values for the ISL8036, ISL8036A are shown in Table 4.

TABLE 4. OUTPUT CAPACITOR VALUE vs V_{OUT} ISL8036, ISL8036A

V_{OUT} (V)	C_{OUT} (µF)	L (µH)
0.8	2 x 22	1.0~2.2
1.2	2 x 22	1.0~2.2
1.6	2 x 22	1.0~2.2
1.8	2 x 22	1.0~3.3
2.5	2 x 22	1.0~3.3
3.3	2 x 6.8	1.0~4.7
3.6	10	1.0~4.7

In Table 4, the minimum output capacitor value is given for different output voltages to make sure the whole converter system is stable.

Output Voltage Selection

The output voltage of the regulator can be programmed via an external resistor divider, which is used to scale the

output voltage relative to the internal reference voltage and feed it back to the inverting input of the error amplifier. Refer to Figure 2.

The output voltage programming resistor, R_2 (or R_5 in Channel 2), will depend on the desired output voltage of the regulator. The value for the feedback resistor is typically between 0Ω and 750kΩ. Let R_2 = 124kΩ, then R_3 will be:

$$R_3 = \frac{R_2 x 0.8V}{V_{OUT} - 0.8V} \quad \text{(EQ. 3)}$$

For better performance, add 12pF in parallel with R_2. If the output voltage desired is 0.8V, then leave R_3 unpopulated and short R_2.

Input Capacitor Selection

The main functions for the input capacitor are to provide decoupling of the parasitic inductance and to provide filtering function to prevent the switching current flowing back to the battery rail. One 22µF X5R or X7R ceramic capacitor is a good starting point for the input capacitor selection per channel.

PCB Layout Recommendation

The PCB layout is a very important converter design step to make sure the designed converter works well. For ISL8036, ISL8036A, the power loop is composed of the output inductor L's, the output capacitor C_{OUT1} and C_{OUT2}, the LX's pins, and the PGND pin. It is necessary to make the power loop as small as possible and the connecting traces among them should be direct, short and wide. The switching node of the converter, the LX_ pins, and the traces connected to the node are very noisy, so keep the voltage feedback trace away from these noisy traces. The FB network should be as close as possible to its FB pin. SGND should have one single connection to PGND. The input capacitor should be placed as closely as possible to the VIN pin. Also, the ground of the input and output capacitors should be connected as closely as possible. The heat of the IC is mainly dissipated through the thermal pad. Maximizing the copper area connected to the thermal pad is preferable. In addition, a solid ground plane is helpful for better EMI performance. It is recommended to add at least 5 vias ground connection within the pad for the best thermal relief.

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest Rev.

DATE	REVISION	CHANGE
10/12/10	FN6853.1	In Table 3 on page 3, corrected F_{SW} for ISL8036 from 1Hz to 1MHz.
9/28/10	FN6853.0	Initial release.

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: ISL8036, ISL8036A

NOTES:

1. Dimensions are in millimeters.
   Dimensions in ( ) for Reference Only.
2. Dimensioning and tolerancing conform to AMSE Y14.5m-1994.
3. Unless otherwise specified, tolerance : Decimal ± 0.05
4. Dimension b applies to the metallized terminal and is measured between 0.15mm and 0.30mm from the terminal tip.
5. Tiebar shown (if present) is a non-functional feature.
6. The configuration of the pin #1 identifier is optional, but must be located within the zone indicated. The pin #1 indentifier may be either a mold or mark feature.
