

**64M bit Synchronous DRAM**

M2V64S20BTP-7,-7L,-8,-8L,-8A,-10,-10L (4-BANK x 4194304-WORD x 4-BIT)

M2V64S30BTP-7,-7L,-8,-8L,-8A,-10,-10L (4-BANK x 2097152-WORD x 8-BIT)

M2V64S40BTP-7,-7L,-8,-8L,-8A,-10,-10L (4-BANK x 1048576-WORD x 16-BIT)

**DESCRIPTION**

The M2V64S20BTP is organized as 4-bank x 4194304-word x 4-bit, M2V64S30BTP is organized as 4-bank x 2097152-word x 8-bit, and M2V64S40BTP is organized as 4-bank x 1048576-word x 16-bit Synchronous DRAM with LVTTTL interface. All inputs and outputs are referenced to the rising edge of CLK. The M2V64S20BTP, M2V64S30BTP, M2V64S40BTP achieve very high speed data rate up to 125MHz, and are suitable for main memory or graphic memory in computer systems.

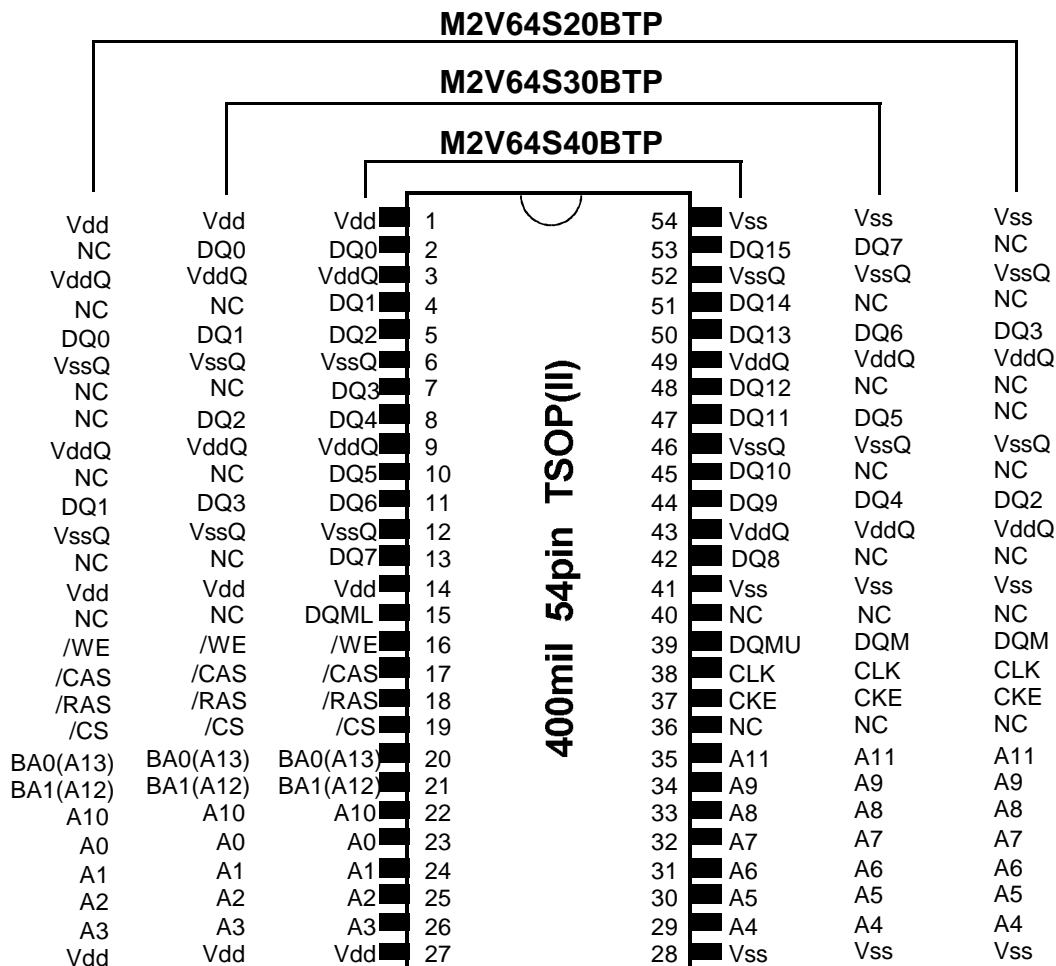

**FEATURES**

- Single 3.3v  $\pm$  0.3v power supply
- Clock frequency 125MHz /100MHz
- Fully synchronous operation referenced to clock rising edge
- 4 bank operation controlled by BA0, BA1 (Bank Address)
- /CAS latency- 2/3 (programmable)
- Burst length- 1/2/4/8/Full Page (programmable)
- Burst type- sequential / interleave (programmable)
- Column access - random
- Burst Write / Single Write (programmable)
- Auto precharge / All bank precharge controlled by A10
- Auto refresh and Self refresh
- 4096 refresh cycles /64ms
- Column address A0-A9 (x4), A0-A8(x8), A0-A7(x16)
- LVTTTL Interface
- 400-mil, 54-pin Thin Small Outline Package (TSOP II) with 0.8mm lead pitch

		Max. Frequency	CLK Access Time
M2V64S20BTP M2V64S30BTP M2V64S40BTP	-7, -7L	100MHz(CL2)	6ns
	-8, -8L	100MHz(CL3)	6ns
	-8A	125MHz	6ns
	-10, -10L	100MHz	8ns

**PIN CONFIGURATION (TOP VIEW)**

- CLK** : Master Clock
- CKE** : Clock Enable
- /CS** : Chip Select
- /RAS** : Row Address Strobe
- /CAS** : Column Address Strobe
- /WE** : Write Enable
- DQ0-3(x4), DQ0-7(x8), DQ0-15(x16)** : Data I/O
- DQM (x4, x8) ,DQML/U (x16)** : Output Disable/ Write Mask
- A0-11** : Address Input
- BA0,1** : Bank Address
- Vdd** : Power Supply
- VddQ** : Power Supply for Output
- Vss** : Ground
- VssQ** : Ground for Output

**Type Designation Code**

This rule is applied only to Synchronous DRAM families beyond 64M B-version.

**64M bit Synchronous DRAM**

M2V64S20BTP-7,-7L,-8,-8L,-8A,-10,-10L (4-BANK x 4194304-WORD x 4-BIT)

M2V64S30BTP-7,-7L,-8,-8L,-8A,-10,-10L (4-BANK x 2097152-WORD x 8-BIT)

M2V64S40BTP-7,-7L,-8,-8L,-8A,-10,-10L (4-BANK x 1048576-WORD x 16-BIT)

**PIN FUNCTION**

CLK	Input	Master Clock: All other inputs are referenced to the rising edge of CLK.
CKE	Input	Clock Enable: CKE controls internal clock. When CKE is low, internal clock for the following cycle is ceased. CKE is also used to select auto / self refresh. After self refresh mode is started, CKE becomes asynchronous input. Self refresh is maintained as long as CKE is low.
/CS	Input	Chip Select: When /CS is high, any command means No Operation.
/RAS, /CAS, /WE	Input	Combination of /RAS, /CAS, /WE defines basic commands.
A0-11	Input	A0-11 specify the Row / Column Address in conjunction with BA0,1. The Row Address is specified by A0-11. The Column Address is specified by A0-A9(x4), A0-A8(x8), A0-7(x16) . A10 is also used to indicate precharge option. When A10 is high at a read / write command, an auto precharge is performed. When A10 is high at a precharge command, all banks are precharged.
BA0,1	Input	Bank Address: BA0,1 specifies one of four banks to which a command is applied. BA0,1 must be set with ACT, PRE, READ, WRITE commands.
DQ0-3(x4), DQ0-7(x8), DQ0-15(x16)	Input / Output	Data In and Data out are referenced to the rising edge of CLK.
DQM(x4,x8), DQMU/L(x16)	Input	Din Mask / Output Disable: When DQMU/L is high in burst write, Din for the current cycle is masked. When DQMU/L is high in burst read, Dout is disabled at the next but one cycle.
Vdd, Vss	Power Supply	Power Supply for the memory array and peripheral circuitry.
VddQ, VssQ	Power Supply	VddQ and VssQ are supplied to the Output Buffers only.

## 64M bit Synchronous DRAM

M2V64S20BTP-7,-7L,-8,-8L,-8A,-10,-10L (4-BANK x 4194304-WORD x 4-BIT)

M2V64S30BTP-7,-7L,-8,-8L,-8A,-10,-10L (4-BANK x 2097152-WORD x 8-BIT)

M2V64S40BTP-7,-7L,-8,-8L,-8A,-10,-10L (4-BANK x 1048576-WORD x 16-BIT)

**BASIC FUNCTIONS**

The M2V64S20(30,40)BTP provides basic functions, bank (row) activate, burst read / write, bank (row) precharge, and auto / self refresh.

Each command is defined by control signals of /RAS, /CAS and /WE at CLK rising edge. In addition to 3 signals, /CS, CKE and A10 are used as chip select, refresh option, and precharge option, respectively. To know the detailed definition of commands, please see the command truth table.

**Activate (ACT) [/RAS =L, /CAS =/WE =H]**

ACT command activates a row in an idle bank indicated by BA.

**Read (READ) [/RAS =H, /CAS =L, /WE =H]**

READ command starts burst read from the active bank indicated by BA. First output data appears after /CAS latency. When A10 =H at this command, the bank is deactivated after the burst read (auto-precharge, **READA**).

**Write (WRITE) [/RAS =H, /CAS =/WE =L]**

WRITE command starts burst write to the active bank indicated by BA. Total data length to be written is set by burst length. When A10 =H at this command, the bank is deactivated after the burst write (auto-precharge, **WRITEA**).

**Precharge (PRE) [/RAS =L, /CAS =H, /WE =L]**

PRE command deactivates the active bank indicated by BA. This command also terminates burst read /write operation. When A10 =H at this command, both banks are deactivated (precharge all, **PREA**).

**Auto-Refresh (REFA) [/RAS =/CAS =L, /WE =CKE =H]**

REFA command starts auto-refresh cycle. Refresh address including bank address are generated inter-nally. After this command, the banks are precharged automatically.

## ABBREVIATIONS:

H=High Level, L=Low Level, X=Don't Care

BA=Bank Address, RA=Row Address, CA=Column Address, NOP=No Operation

## NOTES:

1. All entries assume that CKE was High during the preceding clock cycle and the current clock cycle.
2. ILLEGAL to bank in specified state; function may be legal in the bank indicated by BA, depending on the state of that bank.
3. Must satisfy bus contention, bus turn around, write recovery requirements.
4. NOP to bank precharging or in idle state. May precharge bank indicated by BA.
5. ILLEGAL if any bank is not idle.

ILLEGAL = Device operation and/or data-integrity are not guaranteed.

## ABBREVIATIONS:

H=High Level, L=Low Level, X=Don't Care

## NOTES:

1. CKE Low to High transition will re-enable CLK and other inputs **asynchronously**. A minimum setup time must be satisfied before any command other than EXIT.
2. Power-Down and Self-Refresh can be entered only from the All Banks Idle State.
3. Must be legal command.

SIMPLIFIED STATE DIAGRAM

### POWER ON SEQUENCE

Before starting normal operation, the following power on sequence is necessary to prevent a SDRAM from damaged or malfunctioning.

1. Clock will be applied at power up along with power. Attempt to maintain CKE high, DQM (x4,x8), DQMU/L (x16) high and NOP condition at the inputs along with power.
2. Maintain stable power, stable clock, and NOP input conditions for a minimum of 200us.
3. Issue precharge commands for all banks. (PRE or PREA)
4. After all banks become idle state (after tRP), issue 8 or more auto-refresh commands.
5. Issue a mode register set command to initialize the mode register.

After these sequence, the SDRAM is idle state and ready for normal operation.

### MODE REGISTER

Burst Length, Burst Type and /CAS Latency can be programmed by setting the mode register (MRS). The mode register stores these data until the next MRS command, which may be issued when both banks are in idle state. After tRSC from a MRS command, the SDRAM is ready for new command.

R: Reserved for Future Use  
FP: Full Page

[ /CAS LATENCY ]

/CAS latency, CL, is used to synchronize the first output data with the CLK frequency, i.e., the speed of CLK determines which CL should be used. First output data is available after CL cycles from READ command.

/CAS Latency Timing(BL=4)

[ BURST LENGTH ]

The burst length, BL, determines the number of consecutive writes or reads that will be automatically performed after the initial write or read command. For BL=1,2,4,8, full page the output data is tristated (Hi-Z) after the last read. For BL=FP (Full Page), the TBST (Burst Terminate) command should be issued to stop the output of data.

Burst Length Timing( CL=2 )

Initial Address			BL	Column Addressing

## OPERATIONAL DESCRIPTION

## BANK ACTIVATE

The SDRAM has four independent banks. Each bank is activated by the ACT command with the bank addresses (BA0,1). A row is indicated by the row addresses A11-0. The minimum activation interval between one bank and the other bank is  $t_{RRD}$ . The number of banks which are active concurrently is not limited.

## PRECHARGE

The PRE command deactivates the bank indicated by BA0,1. When multiple banks are active, the precharge all command (PREA, PRE + A10=H) is available to deactivate them at the same time. After  $t_{RP}$  from the precharge, an ACT command to the same bank can be issued.

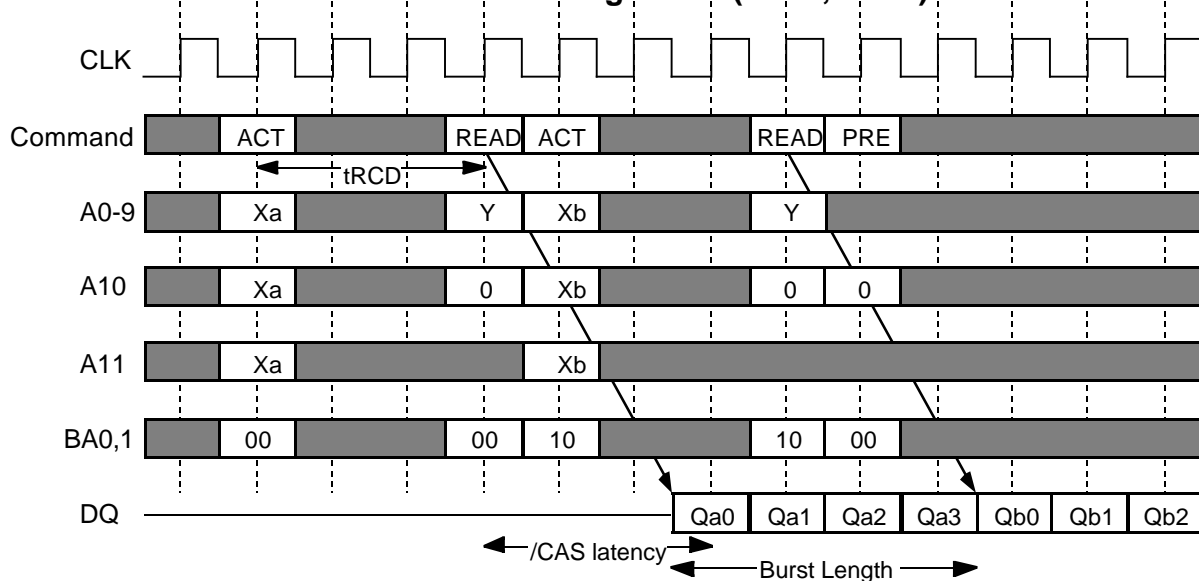

## READ

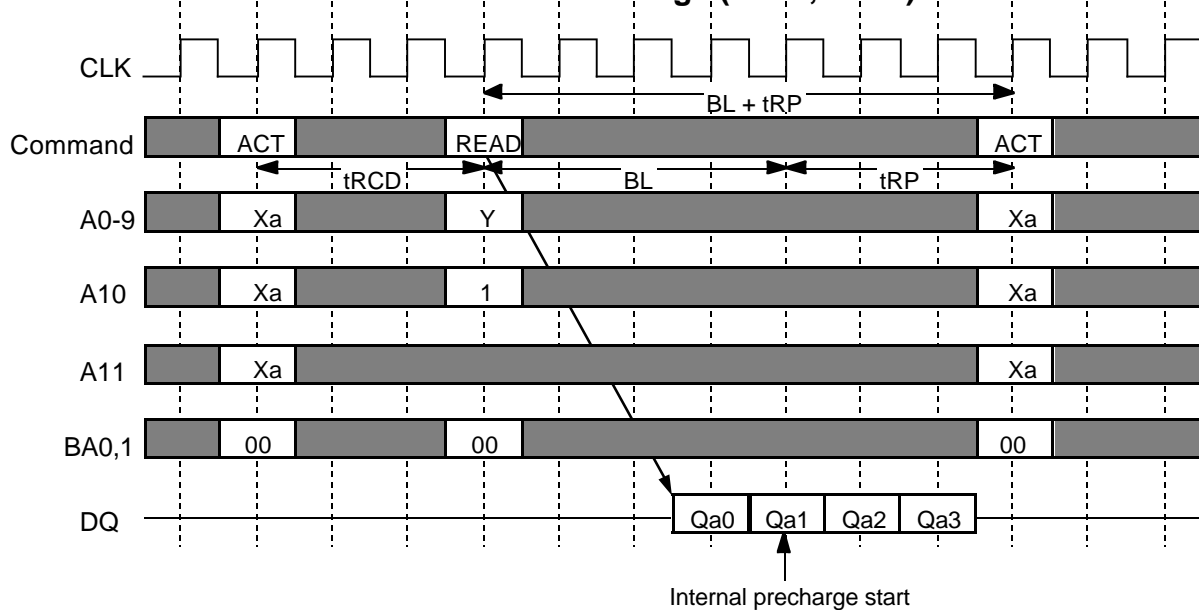

After  $t_{RCD}$  from the bank activation, a READ command can be issued. 1st output data is available after the /CAS Latency from the READ, followed by (BL - 1) consecutive data when the Burst Length is BL. The start address is specified by A9-0(x4), A8-0(x8), A7-0(X16), and the address sequence of burst data is defined by the Burst Type. A READ command may be applied to any active bank, so the row precharge time ( $t_{RP}$ ) can be hidden behind continuous output data by interleaving the multiple banks. When A10 is high at a READ command, the auto-precharge (READA) is performed. Any command (READ, WRITE, PRE, ACT) to the same bank is inhibited till the internal precharge is complete. The internal precharge starts at BL after READA. The next ACT command can be issued after (BL +  $t_{RP}$ ) from the previous READA.

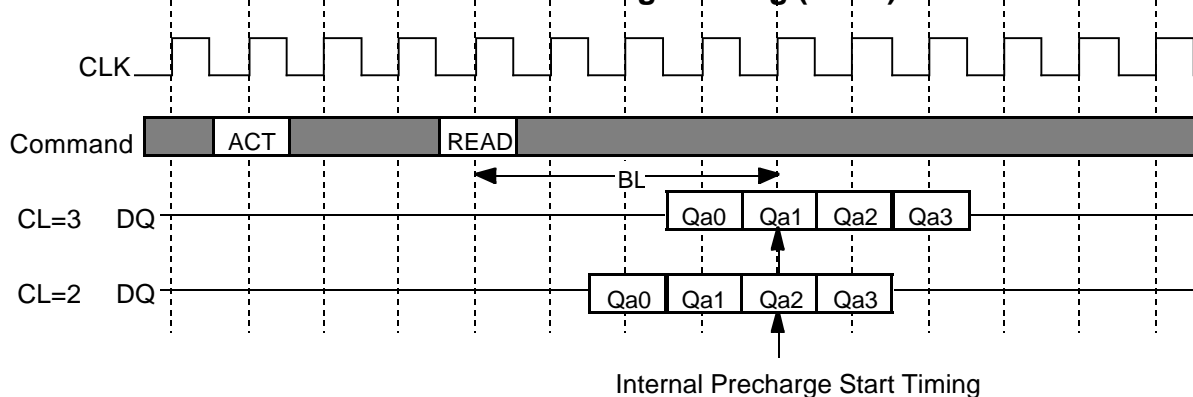

**Multi Bank Interleaving READ (BL=4, CL=3)**

**READ with Auto-Precharge (BL=4, CL=3)**

**READ Auto-Precharge Timing (BL=4)**

**WRITE**

After tRCD from the bank activation, a WRITE command can be issued. 1st input data is set at the same cycle as the WRITE. Following (BL - 1) data are written into the RAM, when the Burst Length is BL. The start address is specified by A9-0 (x 4), A8-0 (x 8) and A7-0 (x 16), and the address sequence of burst data is defined by the Burst Type. A WRITE command may be applied to any active bank, so the row precharge time (tRP) can be hidden behind continuous input data by interleaving the multiple banks. From the last input data to the PRE command, the write recovery time (tWR) is required. When A10 is high at a WRITE command, the auto-precharge (WRITEEA) is performed. Any command (READ, WRITE, PRE, ACT) to the same bank is inhibited till the internal precharge is complete. The internal precharge begins at tWR after the last input data cycle. The next ACT command can be issued after tRP from the internal precharge timing. The Mode Register can be programmed for burst read and single write. In this mode the write data is only clocked in when the WRITE command is issued and the remaining burst length is ignored. The read data burst length is unaffected while in this mode

[ BURST WRITE ]

A burst write operation is enabled by setting A9=0 at MRS. A burst write starts in the same cycle as a write command set. (The latency of data input is 0.) The burst length can be set to 1,2,4,8, and full-page, like burst read operations.

[ SINGLE WRITE ]

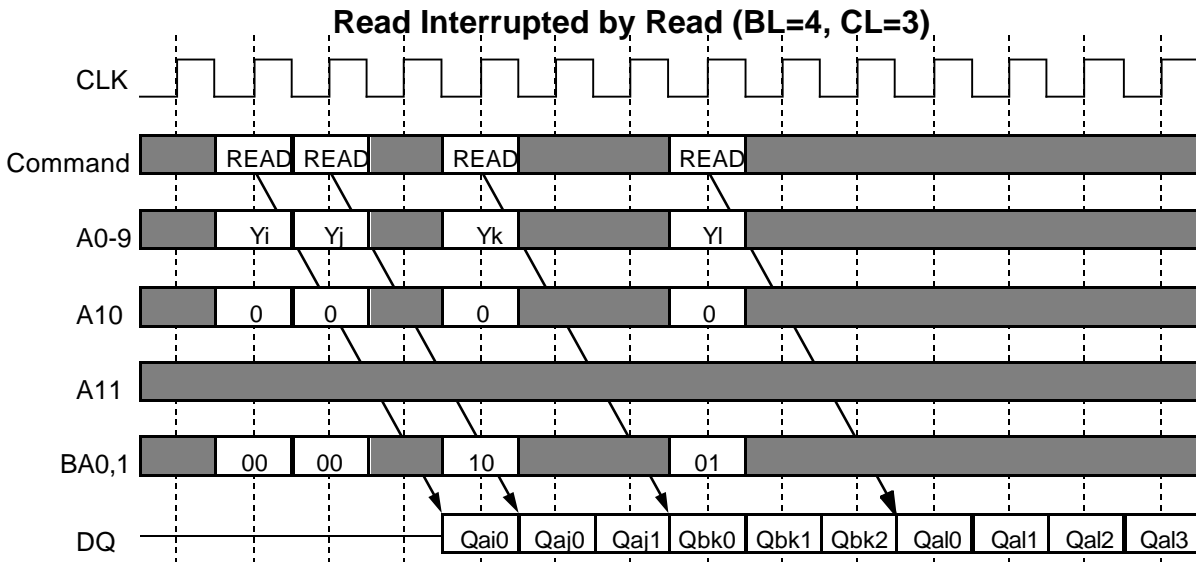

A single write operation is enabled by setting A9=1 at MRS. In a single write operation, data is written only to the column address specified by the write command set cycle without regard to the burst length setting. (The latency of data input is 0.)

**BURST INTERRUPTION**

**[ Read Interrupted by Read ]**

Burst read operation can be interrupted by new read of any bank. Random column access is allowed. READ to READ interval is minimum 1 CLK.

**[ Read Interrupted by Write ]**

Burst read operation can be interrupted by write of any bank. Random column access is allowed. In this case, the DQ should be controlled adequately by using the DQM to prevent the bus contention. The output is disabled automatically 1 cycle after WRITE assertion.

[ Read Interrupted by Precharge ]

Burst read operation can be interrupted by precharge of *the same bank*. READ to PRE interval is mini-mum 1 CLK. A PRE command to output disable latency is equivalent to the /CAS Latency. As a result, READ to PRE interval determines valid data length to be output. The figure below shows examples of BL=4.

**[ Read Interrupted by Burst Terminate ]**

Similar to a precharge, the burst terminate command, TBST, can interrupt the burst read operation and disable the data output. The READ to TBST interval is a minimum of one CLK. TBST is mainly used to interrupt FP bursts. The figures below show examples, of how the output data is terminated with TBST.

[ Write Interrupted by Write ]

Burst write operation can be interrupted by new write of any bank. Random column access is allowed. WRITE to WRITE interval is minimum 1 CLK.

[ Write Interrupted by Read ]

Burst write operation can be interrupted by read of the same or the other bank. Random column access is allowed. WRITE to READ interval is minimum 1 CLK. The input data on DQ at the interrupting READ cycle is "don't care".

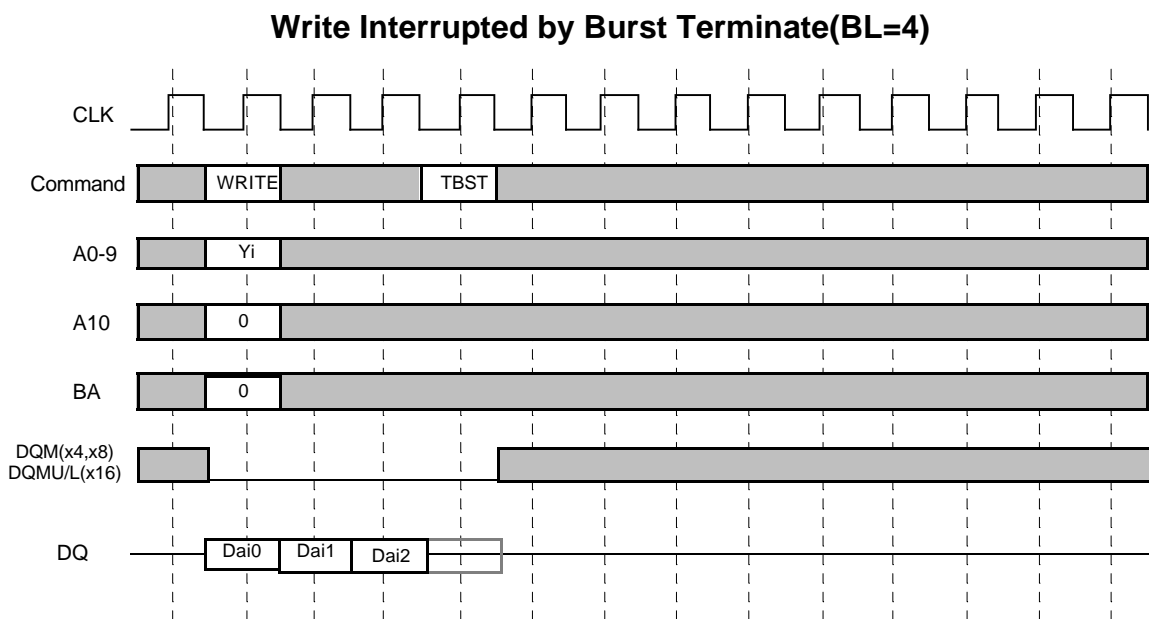

**[ Write Interrupted by Precharge ]**

Burst write operation can be interrupted by precharge of *the same bank*. Random column access is allowed. Write recovery time ( $t_{WR}$ ) is required from the last data to PRE command.

**[ Write Interrupted by Burst Terminate ]**

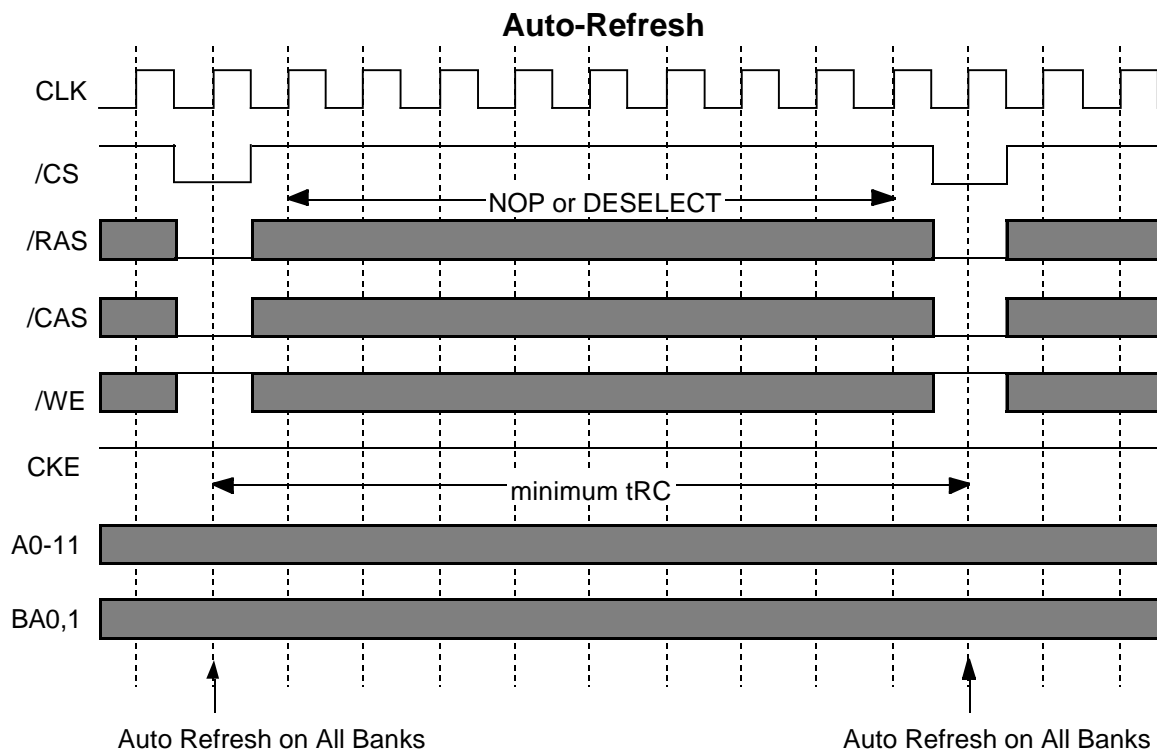

A burst terminate command TBST can be used to terminate a burst write operation. In this case, the write recovery time is not required and the bank remains active (Please see the waveforms below). The WRITE to TBST minimum interval is one CLK.

**AUTO REFRESH**

Single cycle of auto-refresh is initiated with a REFA (/CS= /RAS= /CAS= L, /WE= /CKE= H) command. The refresh address is generated internally. 4096 REFA cycles within 64ms refresh 64Mbit memory cells. The auto-refresh is performed on 4 banks concurrently. Before performing an auto-refresh, all banks must be in the idle state. Auto-refresh to auto-refresh interval is minimum tRC. Any command must not be supplied to the device before tRC from the REFA command.

**SELF REFRESH**

Self-refresh mode is entered by issuing a REFS command (/CS= /RAS= /CAS= L, /WE= H, CKE= L). Once the self-refresh is initiated, it is maintained as long as CKE is kept low. During the self-refresh mode, CKE is asynchronous and the only enabled input, all other inputs including CLK are disabled and ignored, so that power consumption due to synchronous inputs is saved. To exit the self-refresh, supplying stable CLK inputs, asserting DESEL or NOP command and then asserting CKE (REFSX) for longer than tSRX. After tRC from REFSX all banks are in the idle state and a new command can be issued, but DESEL or NOP commands must be asserted till then.

**Self-Refresh**

**CLK SUSPEND**

CKE controls the internal CLK at the following cycle. Figure below shows how CKE works. By negating CKE, the next internal CLK is suspended. The purpose of CLK suspend is power down, output suspend or input suspend. CKE is a synchronous input except during the self-refresh mode. CLK suspend can be performed either when the banks are active or idle. A command at the suspended cycle is ignored.

**Power Down by CKE**

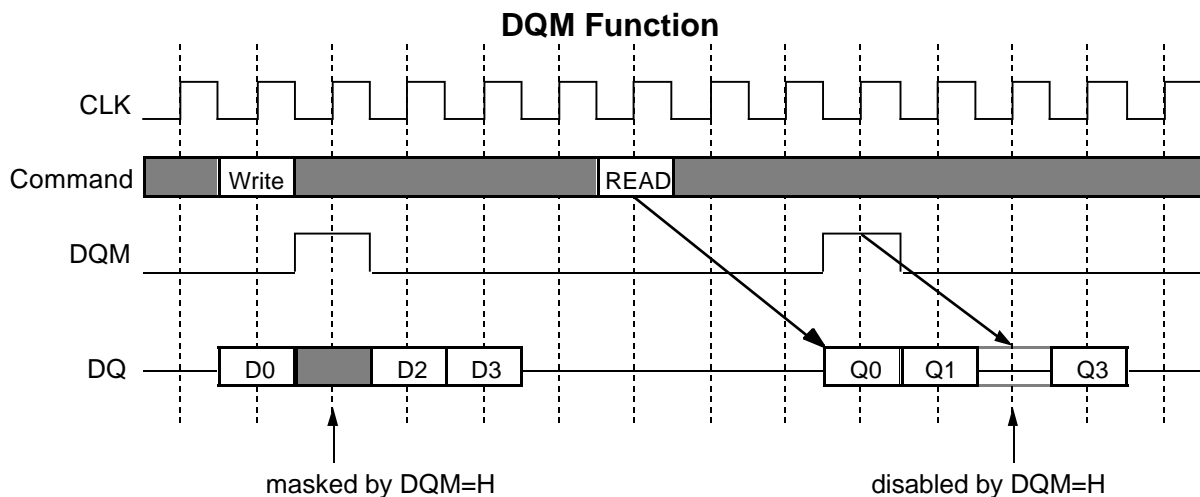

**DQ Suspend by CKE**

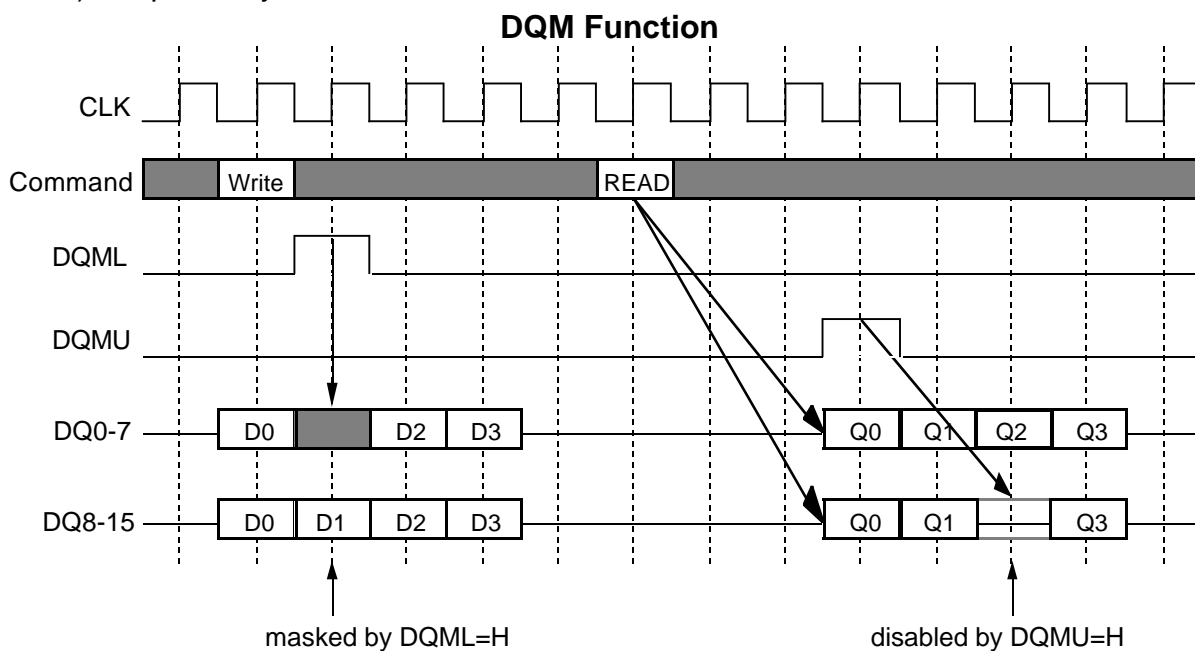

**DQM CONTROL**

For x4/x8, DQM is a dual function signal defined as the data mask for writes and the output disable for reads. During writes, DQM masks input data word by word. DQM to write mask latency is 0. During reads, DQM forces output to Hi-Z word by word. DQM to output Hi-Z latency is 2.

For x16, DQMU/L are dual function signals defined as the data mask for writes and the output disable for reads. During writes, DQMU/L mask input data word by word. DQMU/L to write mask latency is 0. During reads, DQMU/L force outputs to Hi-Z word by word. DQMU/L to output Hi-Z latency is 2. DQML and DQMU control lower byte (DQ0-7), and upper byte (DQ8-15), respectively.

## AC TIMING REQUIREMENTS

(Ta=0 ~ 70°C, Vdd = VddQ = 3.3 ± 0.3V, Vss = VssQ = 0V, unless otherwise noted)

Input Pulse Levels: 0.8V to 2.0V

Input Timing Measurement Level: 1.4V

Symbol	Parameter		Limits								Unit	note
			-7, -7L		-8, -8L		-8A		-10, -10L			
			Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.		
tCLK	CLK cycle time	CL=2	10		13		12		15		ns	
		CL=3	10		10		8		10		ns	
tCH	CLK High pulse width		3		3		3		4		ns	1
tCL	CLK Low pulse width		3		3		3		4		ns	1
tT	Transition time of CLK		1	10	1	10	1	10	1	10	ns	
tIS	Input Setup time (all inputs)		2		2		2		3		ns	1
tIH	Input Hold time (all inputs)		1		1		1		1		ns	1
tRC	Row Cycle time		70		70		70		90		ns	
tRCD	Row to Column Delay		20		20		20		30		ns	
tRAS	Row Active time		50	100000	50	100000	48	100000	60	100000	ns	
tRP	Row Precharge time		20		20		20		30		ns	
tWR	Write Recovery time		10		10		10		10		ns	
tRRD	Act to Act Delay time		20		20		16		20		ns	
tCCD	Col to Col Delay time		10		10		8		10		ns	
tRSC	Mode Register Set Cycle time		20		20		16		20		ns	
tSRX	Self Refresh Exit time		10		10		8		10		ns	
tREF	Refresh Interval time			64		64		64		64	ms	

Note:1 The timing requirements are assumed t<sub>T</sub>=1ns. If t<sub>T</sub> is longer than 1ns, (t<sub>T</sub>-1)ns should be added to the parameter.

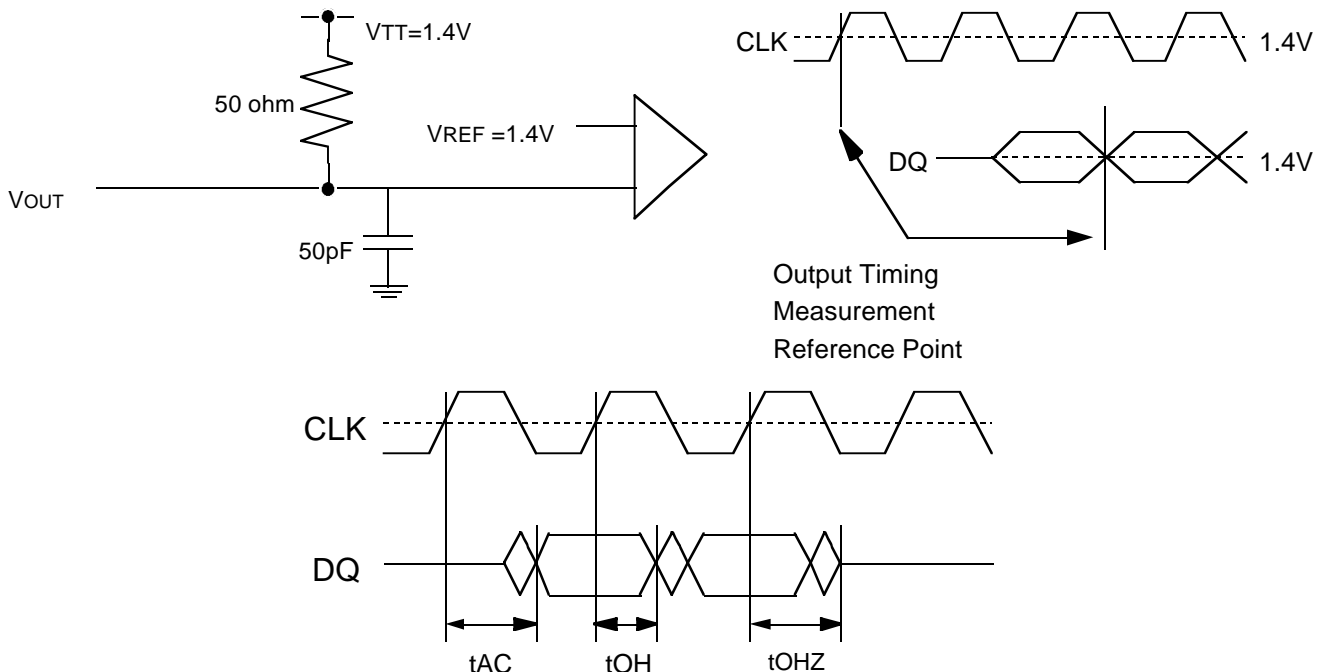

### SWITCHING CHARACTERISTICS

( $T_a=0 \sim 70^\circ\text{C}$ ,  $V_{dd} = V_{ddQ} = 3.3 \pm 0.3\text{v}$ ,  $V_{ss} = V_{ssQ} = 0\text{v}$ , unless otherwise noted see note3)

Symbol	Parameter		Limits								Unit
			-7, -7L		-8, -8L		-8A		-10, -10L		
			Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	
tAC	Access time from CLK	CL=2		6		7		8		8	ns
		CL=3		6		6		6		8	ns
tOH	Output Hold time from CLK		3		3		2.5		3		ns
tOLZ	Delay time, output low impedance from CLK		0		0		0		0		ns
tOHZ	Delay time, output high impedance from CLK		3	6	3	6	2.5	6	3	8	ns

Note:3 If  $t_r$ (clock rising time) is longer than 1ns,  $(t_r/2-0.5)\text{ns}$  should be added to the parameter.

#### Output Load Condition

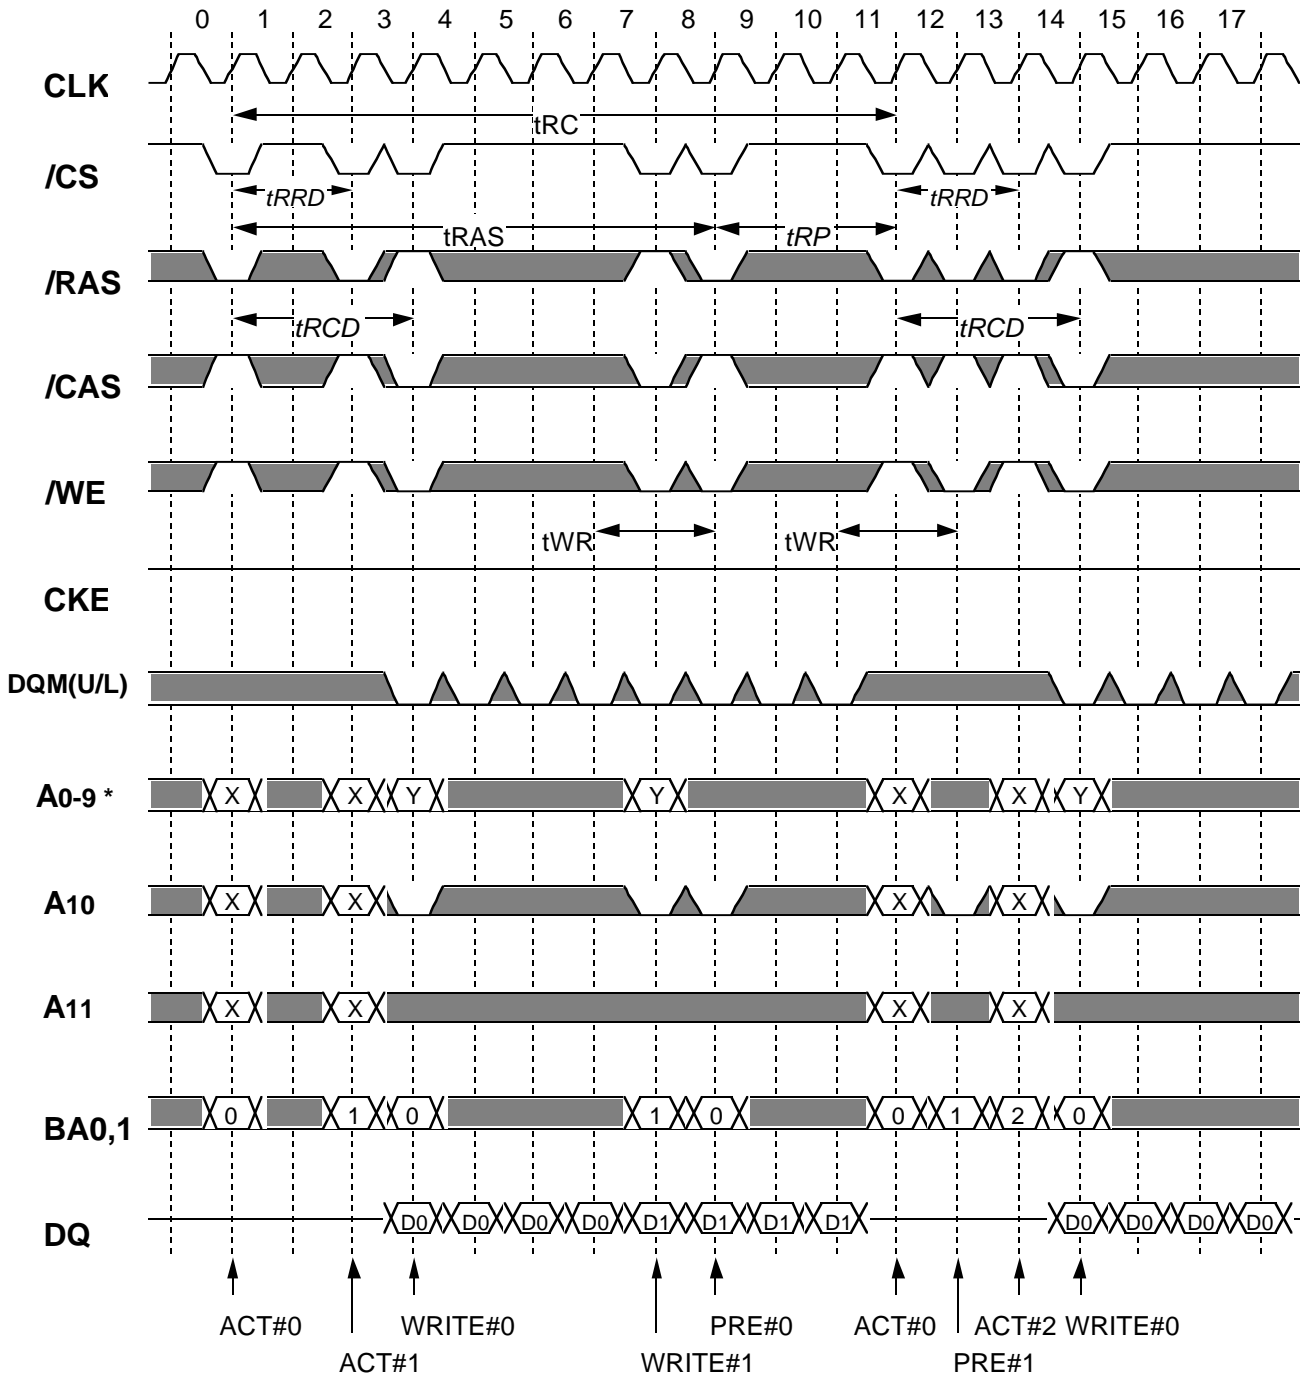

**Burst Write (single bank) @BL=4**

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

**Burst Write (multi bank) @BL=4**

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

**Burst Read (single bank) @BL=4 CL=3**

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

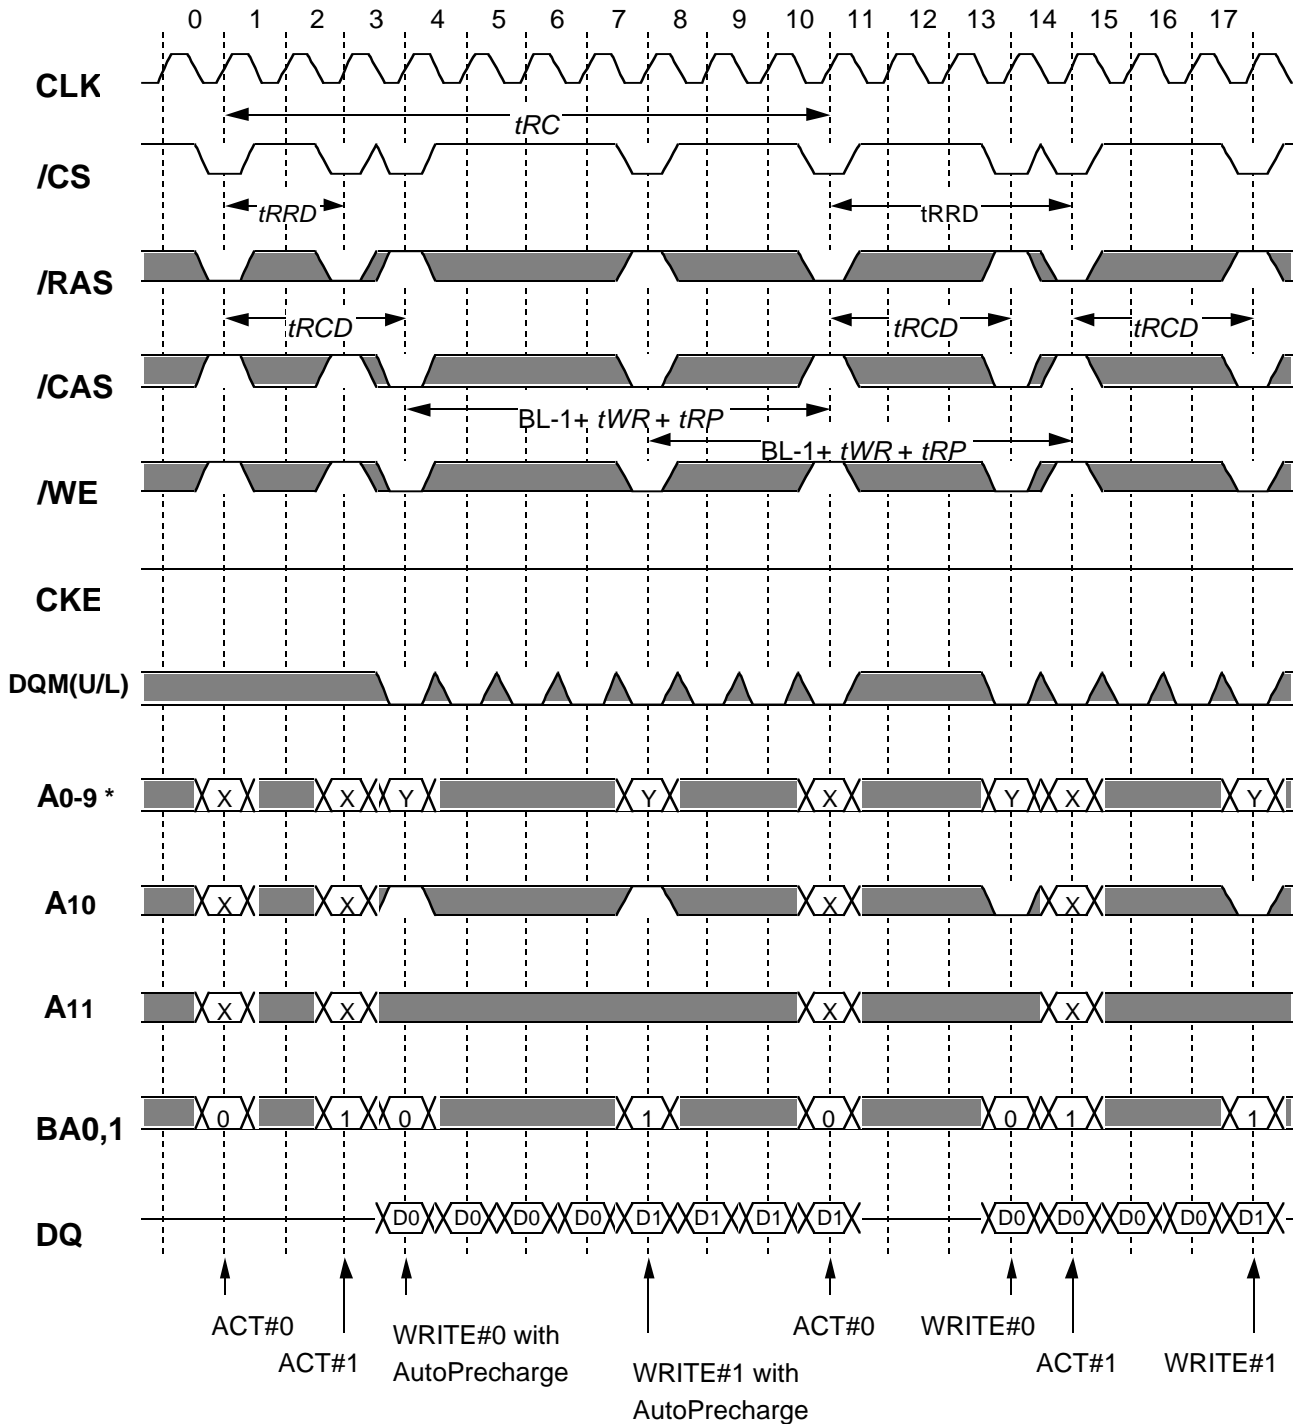

**Burst Read (multiple bank) @BL=4 CL=3**

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

**Burst Write (multi bank) with Auto-Precharge @BL=4**

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

**Burst Read (multiple bank) with Auto-Precharge @BL=4 CL=3**

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

Page Mode Burst Write (multi bank) @BL=4

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

Page Mode Burst Read (multi bank) @BL=4 CL=3

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

Write Interrupted by Write / Read @BL=4

Burst Write can be interrupted by Write or Read of any active bank.

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

Read Interrupted by Read / Write @BL=4 CL=3

Burst Read can be interrupted by Read or Write of any active bank.

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

Write Interrupted by Precharge @BL=4

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

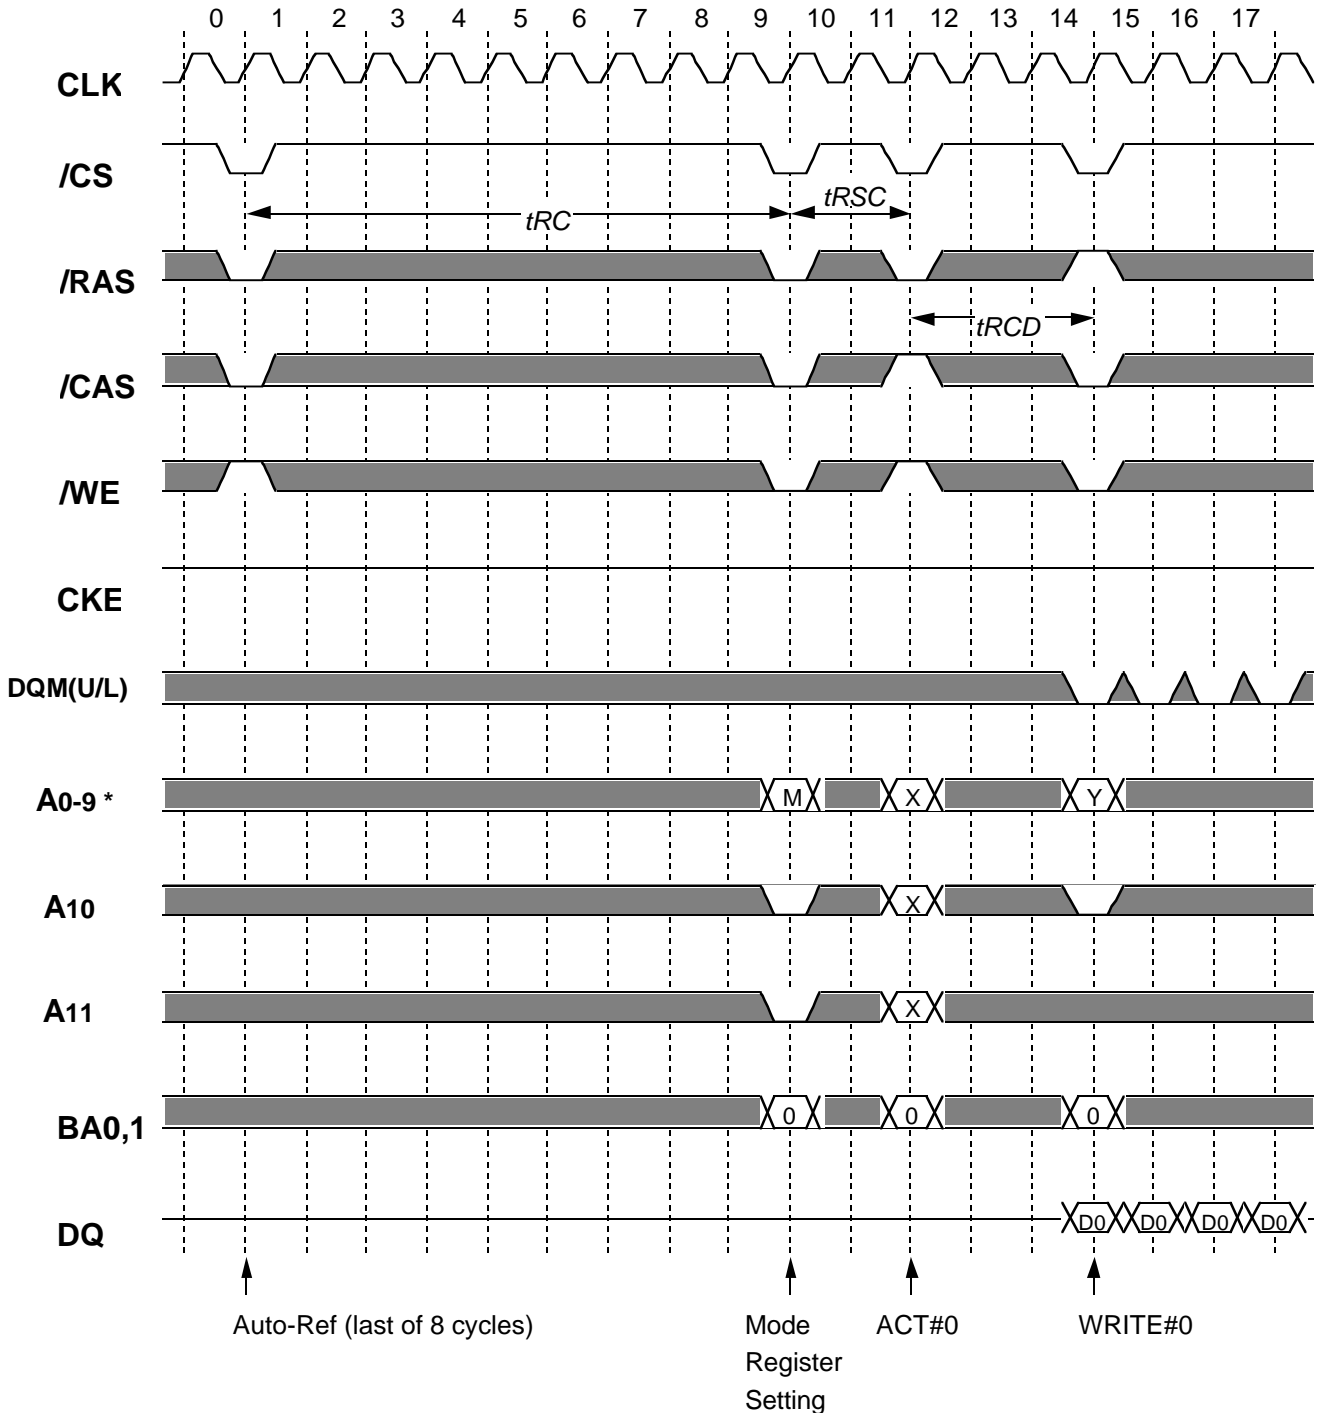

Read Interrupted by Precharge @BL=4 CL=3

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

Mode Register Setting

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

**Auto-Refresh @BL=4**

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

**Self-Refresh**

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

**DQM Write Mask @BL=4**

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

DQM Read Mask @BL=4 CL=3

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

Power Down

*Italic parameter* indicates minimum case

\* A9 (x8) and A8,A9 (x16) for column address of read/write are don't care

L

10-10 (4-10) for bus address of read/write are don't care

## Keep safety first in your circuit designs!

Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

## Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
2. Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams and charts, represent information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
4. Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for special applications, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
5. The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
6. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination. Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
7. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
