

Features

- Supports for synchronous rectification (CH1, CH2 and CH5)
- Supports for down or up-down Zeta conversions (CH1 and APW7095 CH2)
- Supports for up, flyback or up-down SEPIC conversions (APW7095A CH2, CH3, APW7095 CH4, CH5 and CH6)
- Supports for Inverting conversion (APW7095A CH4)
- Low Start-up Voltage : 1.4V (CH6)
- Power Supply Voltage Range
 - CH1 to CH5 : 3.0V to 6.5V
 - CH6 : 2.4V to 6.5V
- 1% Reference Voltage Accuracy
- Wide Operating Frequency 100kHz to 1MHz
- Soft-Start Function (CH1 to 6)
- Power Good (PGOOD) Indicator for CH1
- Low Shutdown Current
- Output Short-Circuit Detections
- Lead Free Available (RoHS Compliant)

General Description

The APW7095/A is a 6-channel, frequency-settable, voltage-mode, DC/DC control IC providing a complete power supply solution for high-performance portable digital cameras. The APW7095/A uses pulse-width-modulation (PWM) and synchronous rectification for high efficiency step-up, step-down, up-down and inverting converters with free input and output settings in 2 or 4-cell AA, 1-cell lithium-ion (Li+), and dual-battery designs. The APW7095/A incorporates error amplifiers, output short-circuit detection, under-voltage lockout, soft-start and output switch control into a chip. The AP7095/A improves performance, component count, and size compared to conventional multi-channel controllers.

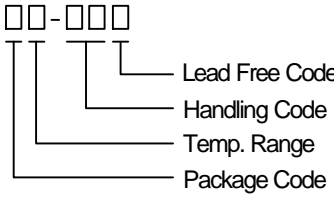

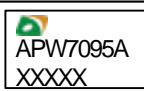

The APW7095/A has a power-good indicator (PGOOD) that signals when CH1 output is within $\pm 10\%$ of the set voltage by monitoring IN1 pin.

The APW7095/A is available in compact 48-pin plastic LQFP and TQFN packages.

Applications

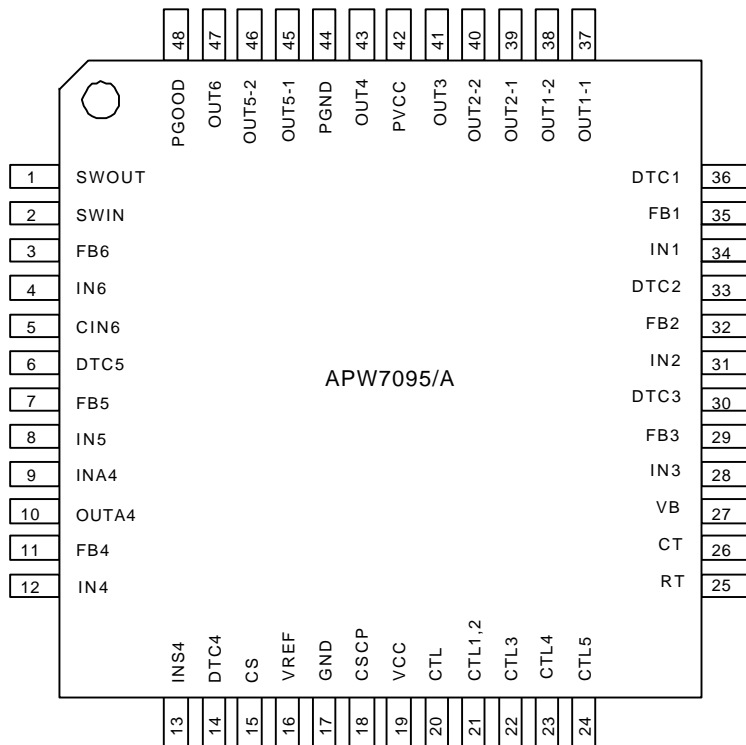

- Digital Camera
- Camcorder
- Hand-held Instrument

Ordering and Marking Information

APW7095/A □□-□□□ 	Package Code QD : LQFP-48 QB : TQFN-48 Operating Ambient Temp. Range E : -30 to 85 °C Handling Code TY : Tray Lead Free Code L : Lead Free Device Blank : Original Device
APW7095 QD/QB : 	XXXXX - Date Code
APW7095A QD/QB : 	XXXXX - Date Code

Note: ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS and compatible with both SnPb and lead-free soldering operations. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J STD-020C for MSL classification at lead-free peak reflow temperature.

Pinouts

Function Descriptions

General

The APW7095/A provides voltage-mode feedback controls for six DC/DC PWM converters(CH1 to CH6). Each channel operates with an error amplifier, PWM comparator, short-circuit comparator, ON/OFF control and output driver. An internal temperature-compensated voltage provides reference voltages for each channel. An triangular-wave oscillator(CT) with a timing resistor and capacitor generates triangular waves to each channel. A inverting amplifier(CH4) cooperates with the error amplifier for an inverting converter (with negative output voltage) .

Reference Voltage

The APW7095 outputs a temperature- compensated reference voltage(2.49V) at VREF pin. It is regulated from the voltage at VCC pin and can source current of max. 1mA to external loads. It also supplies bias for the IC's internal circuitry.

Triangular-wave Oscillator

The triangular-wave oscillator is designed to generate a triangular oscillation signal (CT) with amplitude of 0.3V~0.8V at CT pin, providing signal to CH6. The oscillator frequency is settable from 100kHz to 1MHz and set by a timing resistor and a timing capacitor connected respectively from RT and CT pins to ground. Additional two triangular oscillation signals (CT1 and CT2) are also internally generated with amplitude of 1.1V~1.8V. The CT1 is in phase with the CT to the PWM comparators of CH2 and CH4; the CT2 is out of phase with the CT to the PWM comparators of CH1, CH3 and CH5.

Error Amplifier

The error amplifier is designed with unit-gain-bandwidth of 1MHz and to satisfy wide application requirements. It works with external resistor-capacitor network for each converter's feedback compensation. The loop gain can be set by connecting a feedback resistor and

capacitor from the output pin(FB) to inverted input pin of the error amplifier for stable operations.

Inverting Amplifier (Inv Amp)

The inverting amplifier detects the inverting DC/DC converter output voltage (as a negative voltage) and outputs a control signal to the error amp.

Channel Control Function

The channel control function turns on/off one or more channels depending on the states ("H" or "L" level) at CTL, CTL1,2 to CTL5 pins. The on/off control logic is shown as the following table:

Channel on/off Setting Table

Voltage Level at CTL Pin					Channel ON/OFF State					
CTL	CTL1,2	CTL3	CTL4	CTL5	Power /CH6	CH1 /CH2	CH3	CH4	CH6	
L	x	x	x	x	OFF(Standby State)					
H	L	L	L	L	ON	OFF	OFF	OFF	OFF	
				H				ON	OFF	
			L	ON				OFF		
		H	L	L				OFF	OFF	
				H				ON	OFF	
			H	ON				ON		
	H	L	L	L		ON	ON	OFF	OFF	OFF
				H					ON	OFF
			L	ON					ON	
		H	L	L					OFF	OFF
				H					ON	OFF
			H	ON					ON	

MOSFET Drive Circuits

APW7095/A uses push-pull configuration at output of each MOSFET driver for providing large drive current to MOSFET gate. The following table shows the MOSFETs connected to the drivers:

IC	APW7095	APW7095A
CH1	OUT1-1 : PMOS	OUT1-1 : PMOS
	OUT1-2 : NMOS	OUT1-2 : NMOS
CH2	OUT2-1 : PMOS	OUT2-1 : NMOS
	OUT2-2 : NMOS	OUT2-2 : PMOS
CH3	OUT3 : NMOS	OUT3 : NMOS
CH4	OUT4 : NMOS	OUT4 : PMOS
CH5	OUT5-1 : NMOS	OUT5-1 : NMOS
	OUT5-2 : PMOS	OUT5-2 : PMOS
CH6	OUT6 : NMOS	OUT6 : NMOS

Function Descriptions (Cont.)

Timer-latch short-circuit protection circuit

The short-circuit protection comparator in each channel (CH1 to CH5) monitors converter's output voltage via input pin of error amplifier. In CH6, the short-circuit comparator detects the voltage at output of error amplifier. As any detected voltages of CH1 to CH5 falls below 1.0V or the detected voltage of CH6 is larger than 0.9V, the timer circuits is actuated to start charging the external capacitor C_{SCP} connected from CSCP pin to ground. When the rising voltage of C_{SCP} reaches 0.7V, the IC turns off all external MOSFETs and pulls up the voltage at SWOUT pin. Then the IC is latched. Applying a signal from "L" to "H" to CTL pin enables operation again. The short-circuit detection function remains working during soft start operation on CH1 to CH5.

Under-Voltage Lockout (UVLO) Circuit

The under-voltage lockout circuit monitors the supply voltage at VCC pin to prevent wrong logic control. The IC starts operation after the supply voltage rises above it's rising threshold. As the supply voltage falls below it's falling threshold, the IC turns off the external MOSFETs and pulls up the voltage at SWOUT pin.

Soft-Start Operation

The soft-start function controls the output voltage rate of rise to limit the current surge at start-up. For CH1 to CH5, the soft-start interval is programmed by the soft-start capacitor, C_s connected from CS pin to ground and charged by an internal $1\mu A$ current source. For CH6, a sourcing current from the internal resistor-divider charges the capacitor, C_{CIN6} connected from CIN6 pin to ground, providing soft-start control.

Figure 1 and 2 show the soft-start processes. In figure 1, when all control pins (CTL, CTL1,2 to CTL 5) are driven high ("H" level) at the same time, the voltage at CIN6 pin starts to rise up by charging the capacitor C_{CIN6} , starting a soft-start operation on CH6. After the

rising voltage at CIN6 reaches 0.9V, the reference voltage starts to regulate and the internal source current starts to charge the C_s , starting a soft-start operation on CH1 to CH5. During soft-start interval, the error amplifiers compares the CH1 to CH5 output voltage to the voltage at the CS pin. When any control pins (CH1, 2 to CH5) go "H" from "L" during the soft-start interval (CH1 to CH5), the output rises rapidly to follow the rising voltage at CS pin.

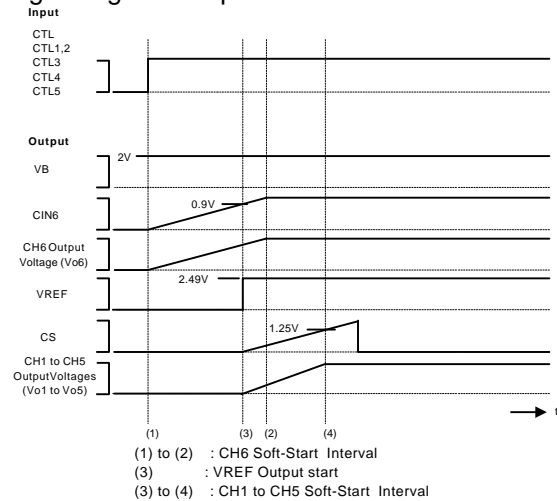

Figure 1 Soft-start waveforms

Figure 2 Soft-start waveforms

Function Descriptions (Cont.)

Output Switch Control Circuit

The output switch control circuit outputs a signal to control external p-channel MOSFETs for preventing reactive current flow to external step-up circuits on CH5 and CH6. When a “H” level signal is applied to SWIN pin after releasing the UVLO and the voltage at CIN6 pin rises above 0.9V(typical), the IC pulls low the voltage at SWOUT pin, turning on the external p-channel MOSFETs to generate output voltages.

Application Information

Soft-Start Interval Settings

The CH6 soft-start time depends on the capacitor C_{CIN6} and is determined as the following equation:

$$t_s (S) = - \frac{C_{CIN6} (F) \cdot 37.5 (k\Omega) \cdot 62.5 (k\Omega)}{100 (k\Omega)} \cdot \ln \left(1 - \frac{V_{CIN6} (V)}{1.26 (V)} \right)$$

The soft-start time until CH6 output voltage reaches 95% of the set voltage is determined as the following equation:

$$t_s (S) \approx 0.07 \cdot C_{CIN6} (mF)$$

On CH1 to CH5, the soft-start time depending on the capacitor C_s determined as the following equation :

$$t_s (S) \approx 1.25 \cdot C_s (mF)$$

Triangular Oscillator Frequency Setting

The triangular oscillator frequency set by the timing capacitor (CT) connected to the CT pin and the timing resistor (RT) connected to the RT pin determined as the following equation:

$$f_{osc} (kHz) \approx \frac{900000}{RT (k\Omega) \cdot CT (pF)}$$

Output Voltage Settings

The output voltage is set by the external resistor-divider connected with converter output, error amplifier input, and ground.

(1) CH1 to CH3, CH5

$$V_o (V) = 1.25V \cdot \left(1 + \frac{R1}{R2} \right)$$

(2) CH4

$$V_o (V) = -1.25V \cdot \frac{R1}{R2}$$

(3) CH6

$$V_o (V) = 1.26V \cdot \left(1 + \frac{R1}{R2} \right)$$

Time Constant Setting for Timer-Latch Short-Circuit Protection Circuit

The time constant for timer-latch short-circuit protection is set by the capacitor C_{SCP} and determined as the following equation :

$$t_{PE} (S) = 0.70 \cdot C_{SCP} (mF)$$

Application Information (Cont.)

Dead-Time Setting

The dead-time control pin (DTC) is designed to set the maximum ON duty of the main-side MOSFET. When the device is set for step-up inverted output based on the step-up or step-up/down Zeta method or flyback method, the FB pin voltage may reach and exceed the triangular wave voltage due to load fluctuation. If this is the case, the output MOSFET is fixed to a ON duty of 100 %. To prevent this, set the maximum duty of the output MOSFET. Connecting a resistor- divider between VREF, DTC and GND pins provides a voltage V_{DTC} to DTC pin. When the the voltage at the DTC pin is higher than the triangular wave voltage (CT1/ 2), the output transistor is turned on. The maximum duty is calculated as the following equation:

$$ON\ Duty_{(max)} = \frac{V_{DTC} - 1.1V}{0.7V} \cdot 100\ (\%)$$

$$V_{DTC}\ (V) = \frac{R2}{R1 + R2} \cdot V_{REF}$$

where V_{REF} is the output of the reference voltage (2.49V typical) at VREF pin. The amplitude of the triangular waves CT1 and CT2 are typically 0.7V from 1.1V to 1.8V.

Physical Specifications

Terminal Material	Solder-Plated Copper (Solder Material : 90/10 or 63/37 SnPb), 100%Sn
Lead Solderability	Meets EIA Specification RSI86-91, ANSI/J-STD-002 Category 3.

Reflow Condition (IR/Convection or VPR Reflow)

Classification Reflow Profiles

Profile Feature	Sn-Pb Eutectic Assembly	Pb-Free Assembly
Average ramp-up rate (T_L to T_P)	3°C/second max.	3°C/second max.
Preheat <ul style="list-style-type: none"> - Temperature Min (T_{smin}) - Temperature Max (T_{smax}) - Time (min to max) (t_s) 	100°C 150°C 60-120 seconds	150°C 200°C 60-180 seconds
Time maintained above: <ul style="list-style-type: none"> - Temperature (T_L) - Time (t_L) 	183°C 60-150 seconds	217°C 60-150 seconds
Peak/Classification Temperature (T_P)	See table 1	See table 2
Time within 5°C of actual Peak Temperature (t_p)	10-30 seconds	20-40 seconds
Ramp-down Rate	6°C/second max.	6°C/second max.
Time 25°C to Peak Temperature	6 minutes max.	8 minutes max.

Notes: All temperatures refer to topside of the package .Measured on the body surface. (mm)

Classification Reflow Profiles(Cont.)

Table 1. SnPb Eutectic Process – Package Peak Reflow Temperatures

Package Thickness	Volume mm ³ <350	Volume mm ³ ≥350
<2.5 mm	240 +0/-5°C	225 +0/-5°C
≥2.5 mm	225 +0/-5°C	225 +0/-5°C

Table 2. Pb-free Process – Package Classification Reflow Temperatures

Package Thickness	Volume mm ³ <350	Volume mm ³ 350-2000	Volume mm ³ >2000
<1.6 mm	260 +0°C*	260 +0°C*	260 +0°C*
1.6 mm – 2.5 mm	260 +0°C*	250 +0°C*	245 +0°C*
≥2.5 mm	250 +0°C*	245 +0°C*	245 +0°C*

*Tolerance: The device manufacturer/supplier shall assure process compatibility up to and including the stated classification temperature (this means Peak reflow temperature +0°C. For example 260°C+0°C) at the rated MSL level.

Reliability Test Program

Test item	Method	Description
SOLDERABILITY	MIL-STD-883D-2003	245°C, 5 SEC
HOLT	MIL-STD-883D-1005.7	1000 Hrs Bias @ 125°C
PCT	JESD-22-B,A102	168 Hrs, 100%RH, 121°C
TST	MIL-STD-883D-1011.9	-65°C~150°C, 200 Cycles
ESD	MIL-STD-883D-3015.7	VHBM > 2KV, VMM > 200V
Latch-Up	JESD 78	10ms, 1 _{tr} > 100mA
