

## 5:1 Intermediate Bus Converter Module: Up to 500 W Output IB050E096T48N1-00

Size:  
2.30 x 0.9 x 0.38 in  
58,4 x 22,9 x 9,5 mm

### Applications

- Enterprise networks
- Optical access networks
- Storage networks
- Automated test equipment

### Features

- Input: 36 – 60 Vdc
- Output: 9.6 Vdc at 48 Vin
- Output current up to 48 A
- Output power: up to 500 W <sup>[A]</sup>
- 2,250 Vdc isolation
- 98% peak efficiency
- Low profile: 0.38" height above board
- Industry standard 1/8 Brick pinout
- Sine Amplitude Converter
- Low noise 1 MHz ZVS/ZCS

<sup>[A]</sup> For lower power applications see 300 W model IB050E096T40N1-00

### Product Overview

The Intermediate Bus Converter (IBC) Module is a very efficient, low profile, isolated, fixed ratio converter for power system applications in enterprise and optical access networks. Rated at up to 345 W from 36 Vin and up to 500 W from 52 to 60 Vin, the IBC conforms to an industry standard eighth brick footprint while supplying the power of a quarter brick. Its leading efficiency enables full load operation at 55°C with only 200 LFM airflow. Its small cross section facilitates unimpeded airflow — above and below its thin body — to minimize the temperature rise of downstream components.

### Absolute Maximum Ratings

	Min	Max	Unit	Notes
Input voltage (+In to -In)				
Operating	36	60	Vdc	
Non-operating		75	Vdc	<100 mS
Input voltage slew rate		5	V/μs	
EN to -IN	-0.5	20	Vdc	
Output voltage (+Out to -Out)	-0.5	13.8	Vdc	
Output current		48	A	Pout ≤ 500 W
Dielectric withstand (input to output)	2,250		Vdc	1 min.
Temperature				
Operating junction	-40	125	°C	Hottest Semiconductor
Storage	-55	125	°C	

## SPECIFICATIONS

All specifications valid at 48 V<sub>IN</sub>, 100% rated load and 25°C ambient, unless otherwise indicated.

Electrical Characteristics						
Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
<b>INPUT</b> (Operating from DC input source)						
Operating input voltage			36	48	60	Vdc
Non-operating input surge withstand		<100 mS			75	Vdc
Operating input dV/dt					5	V/us
Undervoltage protection						
Turn-on			31		36	Vdc
Turn-off			29		34	Vdc
Turn-on/Turn-off hysteresis			2			Vdc
Time constant					7	µs
Undervoltage blanking time		UV blanking time is enabled after start up	50	100	200	µs
Overvoltage protection						
Turn-off			65		69	Vdc
Turn-on			60		69	Vdc
Time constant					4	µs
Turn ON delay						
Start up inhibit		V <sub>IN</sub> reaching turn-on voltage to enable function operational, see Figure 6			15	ms
Turn-on delay		Enable to 90% V <sub>OUT</sub> ; pre-applied V <sub>IN</sub> , see Figure 7, 0 load capacitance			50	µs
Output voltage rise time		From 10% to 90% V <sub>out</sub> , 10% load, 0 load capacitance.			50	µs
Restart turn-on delay		See page 10 for resart after EN pin disable			2000	ms
No Load power dissipation						
Enabled				2.1	2.5	W
Disabled				0.12	0.15	W
Input current		Low line, full load			9.8	A
Inrush current overshoot		Using test circuit in Figure 21		15.0		A
Input reflected ripple current		At max power; Using test circuit in Figure 22			400	mArms
Peak short circuit input current					30	A
Repetitive short circuit peak current					25	A
Internal input capacitance				8.8		µF
Internal input inductance				5		nH
Recommended external input capacitance		200 nH maximum source inductance	47		470	µF
<b>OUTPUT</b>						
DC Output voltage band		No load, over Vin range	7.2	9.6	12.0	V
Output power [a]						
36-55 V <sub>IN</sub>			0		345	W
48-55 V <sub>IN</sub>			0		450	W
52-60 V <sub>IN</sub>			0		500	W
Output current		P ≤ 500 W			48	A
Output start up load		of lout max, maximum output capacitance			15	%
Effective output resistance				4.7		mΩ
Line regulation (K factor)		V <sub>OUT</sub> = K • V <sub>IN</sub> @ no load	0.198	0.200	0.2020	
Current share accuracy		Full power operation; See Parallel Operation on page 11; up to 3 units			10	%

[a] Does not exceed IPC-9592 derating guidelines. At 70°C ambient, full power operation may exceed IPC-9592 guidelines, but does not exceed component ratings, does not activate OTP and does not compromise reliability.

## SPECIFICATIONS (CONT.)

All specifications valid at 48 V<sub>IN</sub>, 100% rated load and 25°C ambient, unless otherwise indicated.

Electrical Characteristics (Continued)						
Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
<b>OUTPUT (Continued)</b>						
Efficiency						
50% load		See Figure 1,2 and 3	97.5	97.9		%

### +In / -In – DC Voltage Input Pins

The IBC input voltage range should not be exceeded. An internal undervoltage/overvoltage lockout function prevents operation outside of the normal operating input range. The IBC turns on within an input voltage window bounded by the “Input under-voltage turn-on” and “Input over-voltage turn-off” levels, as specified. The IBC may be protected against accidental application of a reverse input voltage by the addition of a rectifier in series with the positive input, or a reverse rectifier in shunt with the positive input located on the load side of the input fuse.

The connection of the IBC to its power source should be implemented with minimal distribution inductance. If the interconnect inductance exceeds 100 nH, the input should be bypassed with a RC damper to retain low source impedance and stable operation. With an interconnect inductance of 200 nH, the RC damper may be 47  $\mu$ F in series with 0.3  $\Omega$ . A single electrolytic or equivalent low-Q capacitor may be used in place of the series RC bypass.

### EN - Enable/Disable

#### Negative Logic Option

If the EN port is left floating, the IBC output is disabled. Once this port is pulled lower than 0.8 Vdc with respect to –In, the output is enabled. The EN port can be driven by a relay, opto-coupler, or open collector transistor. Refer to Figures 6 and 7 for the typical enable / disable characteristics. This port should not be toggled at a rate higher than 1 Hz. The EN port should also not be driven by or pulled up to an external voltage source.

#### Positive Logic Option

If the EN port is left floating, the IBC output is enabled. Once this port is pulled lower than 1.4 Vdc with respect to –In, the output is disabled. This action can be realized by employing a relay, opto-coupler, or open collector transistor. This port should not be toggled at a rate higher than 1 Hz.

The EN port should also not be driven by or pulled up to an external voltage source. The EN port can source up to 2 mA at 5 Vdc. The EN port should never be used to sink current.

If the IBC is disabled using the EN pin, the module will attempt to restart approximately every 2000ms. Once the module has been disabled for at least 2000ms, the turn on delay after the EN pin is enabled will be as shown in Figure 7.

### +Out / -Out – DC Voltage Output Pins

Total load capacitance at the output of the IBC should not exceed the specified maximum. Owing to the wide bandwidth and low output impedance of the IBC, low frequency bypass capacitance and significant energy storage may be more densely and efficiently provided by adding capacitance at the input of the IBC.

Figure 30 — IBC Pin Designations

## Parallel Operation

The IBC will inherently current share when operated in an array. Arrays may be used for higher power or redundancy in an application. Current sharing accuracy is maximized when the source and load impedance presented to each IBC within an array are equal. The recommended method to achieve matched impedances is to dedicate common copper planes within the PCB to deliver and return the current to the array, rather than rely upon traces of varying lengths. In typical applications the current being delivered to the load is larger than that sourced from the input, allowing narrower traces to be utilized on the input side if necessary. The use of dedicated power planes is, however, preferable.

One or more IBCs in an array may be disabled without adversely affecting operation or reliability as long as the load does not exceed the rated power of the enabled IBCs.

The IBC power train and control architecture allow bi-directional power transfer, including reverse power processing from the IBC output to its input. The IBC's ability to process power in reverse improves the IBC transient response to an output load dump.

## Thermal Considerations

The temperature distribution of the VI Brick can vary significantly with its input/output operating conditions, thermal management and environmental conditions. Although the PCB is UL rated to 130°C, it is recommended that PCB temperatures be maintained at or below 125°C.

For maximum long term reliability, lower PCB temperatures are recommended for continuous operation, however, short periods of operation at 125°C will not negatively impact performance or reliability.

**WARNING:** Thermal and voltage hazards. The IBC can operate with surface temperatures and operating voltages that may be hazardous to personnel. Ensure that adequate protection is in place to avoid inadvertent contact.

## Input Impedance Recommendations

To take full advantage of the IBC capabilities, the impedance presented to its input terminals must be low from DC to approximately 5 MHz. The source should exhibit low inductance and should have a critically damped response. If the interconnect inductance is excessive, the IBC input pins should be bypassed with an RC damper (e.g., 47  $\mu$ F in series with 0.3  $\Omega$ ) to retain low source impedance and proper operation. Given the wide bandwidth of the IBC, the source response is generally the limiting factor in the overall system response.

Anomalies in the response of the source will appear at the output of the IBC multiplied by its K factor. The DC resistance of the source should be kept as low as possible to minimize voltage deviations. This is especially important if the IBC is operated near low or high line as the overvoltage/undervoltage detection circuitry could be activated.

## Input Fuse Recommendations

The IBC is not internally fused in order to provide flexibility in configuring power systems. However, input line fusing of VI Bricks must always be incorporated within the power system. A fast acting fuse should be placed in series with the +In port. See safety agency approvals.

## Application Notes

For IBC and VI Brick application notes on soldering, thermal management, board layout, and system design visit [vicorpower.com](http://vicorpower.com).

## Warranty

Vicor products are guaranteed for two years from date of shipment against defects in material or workmanship when in normal use and service. This warranty does not extend to products subjected to misuse, accident, or improper application or maintenance. Vicor shall not be liable for collateral or consequential damage. This warranty is extended to the original purchaser only.

EXCEPT FOR THE FOREGOING EXPRESS WARRANTY, VICOR MAKES NO WARRANTY, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Vicor will repair or replace defective products in accordance with its own best judgement. For service under this warranty, the buyer must contact Vicor to obtain a Return Material Authorization (RMA) number and shipping instructions. Products returned without prior authorization will be returned to the buyer. The buyer will pay all charges incurred in returning the product to the factory. Vicor will pay all reshipment charges if the product was defective within the terms of this warranty.

Information published by Vicor has been carefully checked and is believed to be accurate; however, no responsibility is assumed for inaccuracies. Vicor reserves the right to make changes to any products without further notice to improve reliability, function, or design. Vicor does not assume any liability arising out of the application or use of any product or circuit; neither does it convey any license under its patent rights nor the rights of others. Vicor general policy does not recommend the use of its components in life support applications wherein a failure or malfunction may directly threaten life or injury. Per Vicor Terms and Conditions of Sale, the user of Vicor components in life support applications assumes all risks of such use and indemnifies Vicor against all damages.

## **Vicor's comprehensive line of power solutions includes high density AC-DC and DC-DC modules and accessory components, fully configurable AC-DC and DC-DC power supplies, and complete custom power systems.**

Information furnished by Vicor is believed to be accurate and reliable. However, no responsibility is assumed by Vicor for its use. Vicor components are not designed to be used in applications, such as life support systems, wherein a failure or malfunction could result in injury or death. All sales are subject to Vicor's Terms and Conditions of Sale, which are available upon request.

## **Specifications are subject to change without notice.**
