Register detail description

Register R0:

Control and switch the relationship between the inputs VA, VB, VC and outputs R, G, B.

This function is used to match different types of color filters.

D2	D1	D0	Output (n=1 to 160)			
			R	G	B	
0	0	0	R	G	B	
			R	G	B	Odd Line
0	0	1	G	B	R	Even Line

“X” => Regardless

Register R1:

Set the scan direction, reset, and standby mode.

Bit	Function
D0	Up/down scan direction. "1"=> Down to up. "0"=> Up to down (Default).
D1	Left/Right scan direction. "1"=> Left to right. (Default) "0"=>Right to left.
D2	Global reset pin, it should be connected to VCC in normal operation. IF connected to GND, the controller is in reset state, normally pulled high.
D3	Standby mode, active low. Normally pulled high.

Default scan direction is below:

Register **R2**:

1	0	0	5.2
1	0	1	5.4
1	1	0	5.6(Default)
1	1	1	5.8

D3: Set the polarity of APOL. If D3=0, then the polarity of APOL is the same as the polarity of DFRP. As below:

If D3=1, then the polarity of APOL is inverted. As below:

D3	Control APOL are inverted or not, normally pulled low. '0'=>The APOL polarity, the same as DFRP, is negative at the first line. '1'=>The APOL polarity will be inverted.
----	--

Register R5:

In this register, the input format of NTSC/PAL is setting here. It would be set by AUTO-selection of external setting. Apart from this 4:3 mode to 16:9 mode is also setting be D2 bit. And the sync polarity could be set by positive and negative.

Bit	Function
D0	Data format auto selection pin, normally pulled high. '1'=>Data format is auto selection. '0'=>Data format is decided by D1.
D1	Data format selection pin, normally pulled low. '1'=>PAL. '0'=>NTSC.
D2	Wide display format selection pin, normally pulled low. '1'=>16:9 wide display. '0'=>Normally display.
D3	Horizontal and vertical sync edge selection, normally pulled low. '0'=>Horizontal and vertical sync input. Positive polarity. '1'=> Horizontal and vertical sync input. Negative polarity.

Register R6

In this register, PLL clock is generated by internal synchronize signal. And the PLL frequency can be set to adjust 4:3 circle ratio.

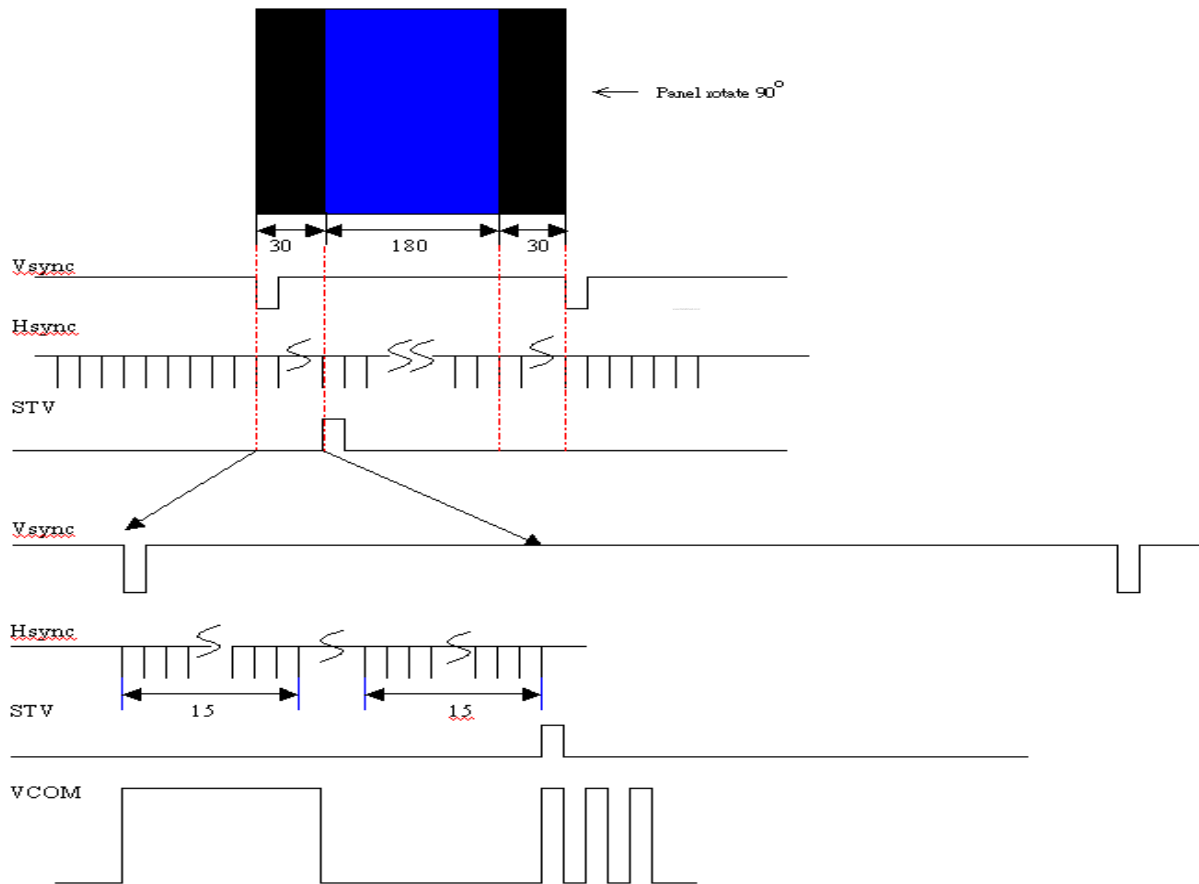

Bit	Function																																																	
D0	Shut down pin for PWM control circuit, normally pulled low. '1'=>PWM control circuit is working normally.. '0'=>PWM control circuit is shut down..																																																	
D1	Disable PLL pin, normally pulled low. '1'=>PLL is disabled and CLK must be input externally. '0'=>CLK is generated by PLL.																																																	
D2,D3,D4	PLL frequency selection. Note 3.

Note 3. NTSC default setting is 594.

PAL default setting is 616.

7.16:9 Wide display

Since the input signal is 240 valid lines. In order to keep 16:9 format, 1/4 lines will be cancelled on the input signal. So the valid lines is $240 \times 0.75 = 180$, Apart from this method, we will also write the black data to TFT. And the black lines are 60 lines where occupied on the up site and bottom site separately.

From above figure, we know that when in black region, we turn on the 15 gate pulses once and then turn on the other 15 gate pulses once. In display region, we show 180 lines normally. Last the black region will be showed and the method is the same as the first 30 lines.

8. DC-DC Converter Circuit

A024CN00 contains one high-power step-up DC-DC converter, and backplane drive circuitry for active matrix TFT LCDs. The output voltage of the main boost converter can be set from VCC to 22V with external resistors. A024CN00 design also include a precision 0.6V reference voltage, fault detection, and logic shutdown.

a .Boost Converter

A024CN00 main boost converter uses a boost PWM architecture to produce a positive regulated voltage, please refer to the below figures to see the block diagram.

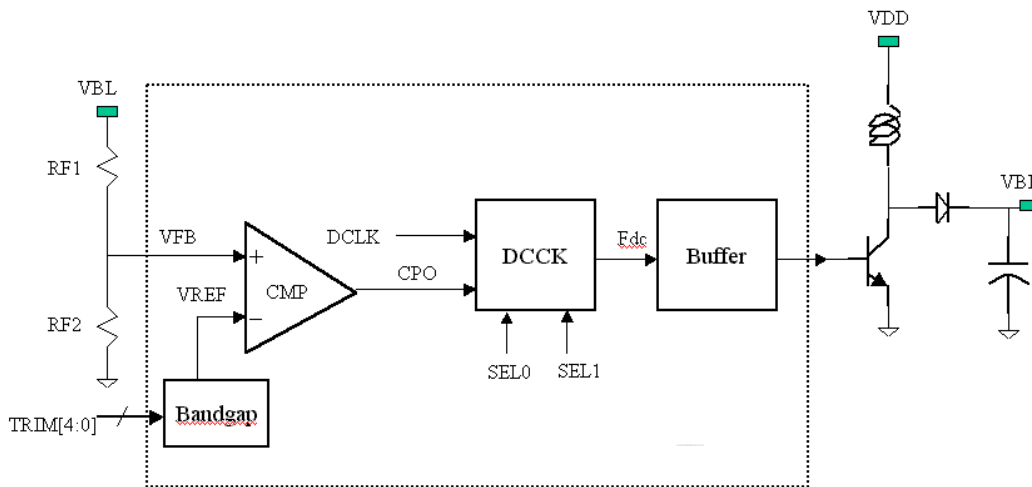

Fig 1 Dc-Dc converter block diagram

In the internal architecture of DC-DC converter. The feedback voltage(VFB) will connect to the triangle waveform comparator, and generates the output signal (CPO) which determines the duty cycle for (Fdc).

Fig 2 DC CK block diagram

To reduce the noise affect, CP0 will be processed by De-bounce circuit. State-machine will generate the duty cycle by CP0 signal. In order to make sure that VFB can reach default VREF quickly, State-machine's is designed with discrete step by step function (please refer to Fig 3). If CP0 is low, the duty cycle will work from 0% to 83% with the maximum duty ratio to 83%.

Viewing angle	Top	$CR \geq 10$	10	-	-	deg.	Note 6, 7
	Bottom		30	-	-		
	Left		40	-	-		
	Right		40	-	-		
Transmission	Y_L	$\theta = 0^\circ$	-	7.3	-	%	Note 8

V-T Curve:

Transmission	Liquid Crystal Voltage (V)		
	Min.	Typ.	Max.
90%	1.5	1.8	2
50%	2.2	2.5	2.8
10%	2.9	3.25	3.5

Note 1. Ambient temperature =25°C.

Note 2. To be measured in the dark room.

Note 3. To be measured on the center area of panel with a field angle of 1° by Topcon luminance meter BM-7, after 10 minutes operation.

Note 4. Definition of response time:

The output signals of photo detector are measured when the input signals are changed from “black” to “white”(falling time) and from “white” to “black”(rising time), respectively. The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to figure as below.

Note 5. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Photo detector output when LCD is at "White" state}}{\text{Photo detector output when LCD is at "Black" state}}$$

Note 6. White $V_i = V_{i50} \mp 1.5V$

Black $V_i = V_{i50} \pm 2.0V$

“±” Means that the analog input signal swings in phase with COM signal.

“∓” Means that the analog input signal swings out of phase with COM signal.

V_{i50} : The analog input voltage when transmission is 50%

The 100% transmission is defined as the transmission of LCD panel when all the input terminals of module are electrically opened.

Note 7. Definition of viewing angle:

Refer to figure as below.

Note 8. Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened without APCF (Light enhancement film).

D. Reliability test items:

No.	Test items	Conditions	Remark
1	High temperature storage	Ta= 80°C 240Hrs	
2	Low temperature storage	Ta= -25°C 240Hrs	
3	High temperature operation	Ta= 60°C 240Hrs	
4	Low temperature operation	Ta= 0°C 240Hrs	
5	High temperature and high humidity	Ta= 60°C . 90% RH 240Hrs	Operation
6	Heat shock	-25°C~80°C/50 cycle @ 2hrs/cycle	Non-operation
7	Electrostatic discharge	±200V,200pF(0Ω), once for each terminal	Non-operation
8	Vibration	Frequency range : 10~55Hz	JIS C7021, A-10 condition A
		Stoke : 1.5mm	
		Sweep : 10~55Hz~10Hz	
		2 hours for each direction of X, Y, Z (6 hours for total)	
9	Mechanical shock	100G . 6ms, ±X,±Y,±Z 3 times for each direction	JIS C7021, A-7 condition C
10	Vibration (with carton)	Random vibration: 0.015G ² /Hz from 5~200Hz -6dB/Octave from 200~500Hz	IEC 68-34
11	Drop (with carton)	Height: 80cm 1 corner, 3 edges, 6 surfaces	
12	The copper's strength for FPC	The strength is larger 0.7 kg/cm	IPC TM650
13	The film's strength for FPC	The strength is larger 0.35 kg/cm	IPC TM650

Notice for backlight design and assembly:

This panel does not have side panel coating. To prevent VCOM or other electronic short, please avoid metal (i.e. bezel) contact with LC injection sealant located at central portion of upper glass side.
