3-PHASE BRIDGE DRIVER

Features

- Floating channel designed for bootstrap operation
- Fully operational to +600 V
- Tolerant to negative transient voltage, dV/dt immune
- Gate drive supply range from 10 V to 20 V (IRS2136/ IRS21368), 11.5 V to 20 V (IRS21362), or 12 V to 20 V (IRS21363/IRS21365/IRS21366/IRS21367)
- Undervoltage lockout for all channels
- Over-current shutdown turns off all six drivers
- Independent 3 half-bridge drivers
- Matched propagation delay for all channels
- Cross-conduction prevention logic
- Low side output out of phase with inputs. High side outputs out of phase (IRS213(6,63, 65, 66, 67, 68)), or in phase (IRS21362) with inputs
- 3.3 V logic compatible
- Lower di/dt gate drive for better noise immunity
- Externally programmable delay for automatic fault clear
- All parts are LEAD-FREE

Packages

Applications:

- *Motor Control
- *Air Conditioners/ Washing Machines
- *General Purpose Inverters
- *Micro/Mini Inverter Drives

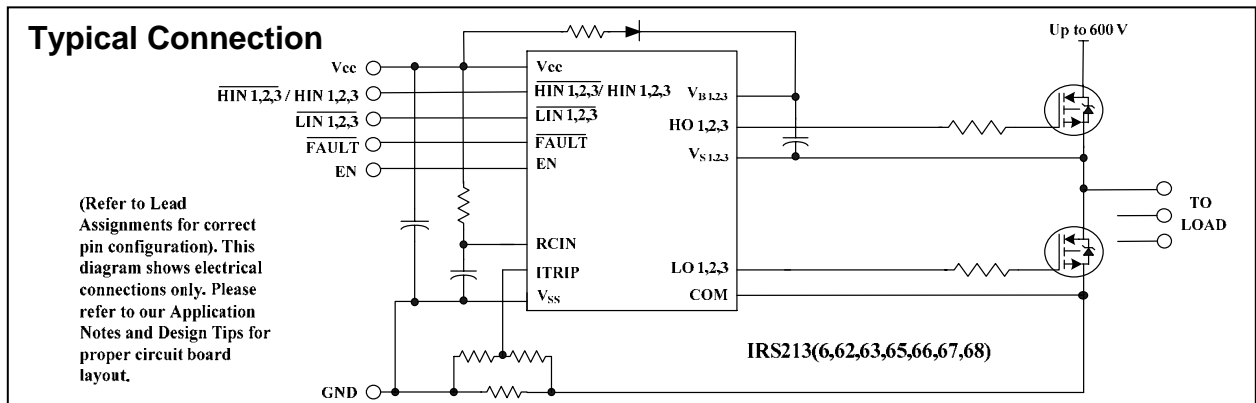

Description

The IRS2136x are high voltage, high speed power MOSFET and IGBT driver with three independent high side and low side referenced output channels for 3-phase applications. Proprietary HVIC technology enables ruggedized monolithic construction. Logic inputs are compatible with CMOS or LSTTL outputs, down to 3.3 V logic. A current trip function which terminates all six outputs can be derived from an external current sense resistor. An enable function is available to terminate all six outputs simultaneously. An open-drain FAULT signal is provided to indicate that an overcurrent or undervoltage shutdown has occurred. Overcurrent fault conditions are cleared automatically after a delay programmed externally via an RC network connected to the RCIN input. The output drivers feature a high pulse current buffer stage designed for minimum driver cross-conduction. Propagation delays are matched to simplify use in high frequency applications. The floating channels can be used to drive N-channel power MOSFETs or IGBTs in the high side configuration which operates up to 600 V.

Absolute Maximum Ratings

Absolute Maximum Ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to COM. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions. Zener clamps are included between V_{CC} & COM (25 V), V_{CC} & V_{SS} (20V), and V_{Bx} & V_{Sx} (20 V).

Symbol	Description
V_{CC}	Low side supply voltage
V_{SS}	Logic ground
HIN1,2,3 HIN1,2,3	Logic inputs for high side gate driver outputs (HO1,2,3), out of phase [IRS213(6,63,65,66,67,68)] Logic inputs for high side gate driver outputs (HO1,2,3), in Phase (IRS21362)
LIN1,2,3	Logic input for low side gate driver outputs (LO1,2,3), out of phase
FAULT	Indicates over-current (ITRIP) or low-side undervoltage lockout has occurred. negative logic, open-drain output
EN	Logic input to enable I/O functionality. I/O logic functions when ENABLE is high (i.e., positive logic). No effect on FAULT and not latched
ITRIP	Analog input for overcurrent shutdown. when active, ITRIP shuts down outputs and activates $\overline{\text{FAULT}}$ and RCIN low. when ITRIP becomes inactive, $\overline{\text{FAULT}}$ stays active low for an externally set time T_{FLTCLR} , then automatically becomes inactive (open-drain high impedance).
RCIN	External RC network input used to define FAULT CLEAR delay, T_{FLTCLR} , approximately equal to $R \cdot C$. when $\text{RCIN} > 8 \text{ V}$, the FAULT pin goes back into open-drain high-impedance
COM	Low side gate drivers return
$V_{B1,2,3}$	High side floating supply
HO1,2,3	High side gate driver outputs
$V_{S1,2,3}$	High voltage floating supply return
LO1,2,3	Low side driver sourcing outputs

Note: LIN, HIN, EN, and ITRIP are internally clamped with a 5.2 V zener diode.

1 PCB Layout Tips

1.1 Distance from H to L Voltage

The IRS2136xJ package lacks some pins (see page 11) in order to maximizing the distance between the high voltage and low voltage pins. It's strongly recommended to place the components tied to the floating voltage in the respective high voltage portions of the device ($V_{B1,2,3}$, $V_{S1,2,3}$) side.

1.2 Ground Plane

To minimize noise coupling ground plane must not be placed under or near the high voltage floating side.

1.3 Gate Drive Loops

Current loops behave like an antenna able to receive and transmit EM noise (see Fig. 7). In order to reduce EM coupling and improve the power switch turn on/off performances, gate drive loops must be reduced as much as possible. Moreover, current can be injected inside the gate drive loop via the IGBT collector-to-gate parasitic capacitance. The parasitic auto-inductance of the gate loop contributes to develop a voltage across the gate-emitter increasing the possibility of self turn-on effect.

Fig. 7. Antenna Loops

1.4 Supply Capacitors

Supply capacitors must be placed as close as possible to the device pins (V_{CC} and V_{SS} for the ground tied supply, V_B and V_S for the floating supply) in order to minimize parasitic inductance/resistance.

1.5 Routing and Placement

Power stage PCB parasitic may generate dangerous voltage transients for the gate driver and the control logic. In particular it's recommended to limit phase voltage negative transients.

In order to avoid such undervoltage it is highly recommended to minimize high side emitter to low side collector distance and low side emitter to negative bus rail stray inductance. See DT04-4 at www.irf.com for more detailed information.

Figures 8-28 provide information on the experimental performance of the IRS2136S HVIC. The line plotted in each figure is generated from actual lab data. A large number of individual samples were tested at three temperatures (-40 °C, 25 °C, and 125 °C) in order to generate the experimental (Exp.) curve. The line labeled Exp. consist of three data points (one data point at each of the tested temperatures) that have been connected together to illustrate the understood trend. The individual data points on the curve were determined by calculating the averaged experimental value of the parameter (for a given temperature).
