DUAL RAD HARD + /- VOLTAGE REGULATOR
# 5911RH SERIES

4707 Dey Road Liverpool, N.Y. 13088

(315) 701-6751

FEATURES:

- Total Dose Tested to 300K RAD(Si) (Method 1019.7 Condition A)
- Internal Thermal Overload Protection
- Output Current to 1.5 Amps
- Output Voltage Internally Trimmed to ±1% Accuracy
- Lead Form Options: Straight and Gull Wing
- Alternate Voltage Combinations Available
- Contact MSK for MIL-PRF-38534 Qualification Status

**MSK591XRH**   **MSK591XRHG**

DESCRIPTION:

The MSK 5911RH series are dual Radiation Hardened + /- voltage regulators offering low dropout and output accuracy to ±1% maximum. Excellent line and load regulation characteristics ensure highly accurate performance. The MSK 5911RH series regulators are equipped with internal thermal overload protection. The devices are packaged in a space efficient 20 pin flatpack with two lead form options, straight and gull wing.

EQUIVALENT SCHEMATIC

TYPICAL APPLICATIONS

- Switching Power Supply Post Regulators
- Constant Voltage/Current Regulators
- High Efficiency Linear Regulators

NOTES:

① Guaranteed by design but not tested. Typical parameters are representative of actual device performance but are for reference only.
② Industrial grade and "E" suffix devices shall be tested to subgroup 1 unless otherwise specified.
③ Military grade devices shall be 100% tested to subgroups 1,2 and 3.
④ Subgroup 1   T$_A$ = T$_C$ = +25°C
   Subgroup 2   T$_A$ = T$_C$ = +125°C
   Subgroup 3   T$_A$ = T$_C$ = -55°C
⑤ Please consult the factory if alternate output voltages are required.
⑥ For positive regulator, output decoupled to ground using 1μF minimum tantalum capacitor unless otherwise specified. For negative regulator, output decoupled to ground using 1μF minimum tantanlum capacitor.
⑦ Continuous operation at or above absolute maximum ratings may adversely effect the device performance and/or life cycle.
⑧ Pre and post irradiation limits at 25°C, up to 100Krad TID, are identical unless otherwise specified.

CAPACITOR SELECTION

POSITIVE REGULATOR

INPUT CAPACITOR:

An input bypass capacitor is recommenced when using the MSK 5911 series regulators. This is especially true if the regulator is located farther than 6 inches from the power supply filter capacitors. For most applications a 1μF solid tantalum capacitor will be suitable.

OUTPUT CAPACITOR:

A minimum of a 1μF solid tantalum capacitor should also be used at the output to insure stability. Any increase of this output capacitor larger than 10μF will only improve output impedance.

+C$_{COMP}$ CAPACITOR:

For improved ripple rejection, +Ccomp can be bypassed to ground with a 10μF tantalum capacitor. This bypass capacitor will provide 80dB ripple rejection. Increased capacitance above 10μF does not improve the ripple rejection at frequencies above 120Hz. If the Ccomp bypass capacitor is used, it may be necessary to add a protection diode to protect the regulator from capacitor discharge damage. See Typical Applications Circuit for clarification. If the bypass capacitor is not used, it should be left open since it is internally connected to the regulator.

NEGATIVE REGULATOR

INPUT CAPACITOR:

Once again, if the regulator will be farther than 6 inches from power supply filter capacitors, then an input capacitor will be required on the negative regulator. It is recommended that a 1μF solid tantalum capacitor be used.
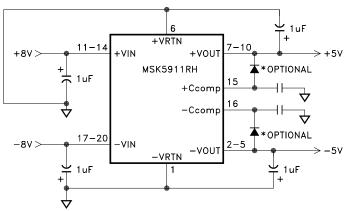

OUTPUT CAPACITOR:

A minimum of a 1μF solid tantalum capacitor should also be used at the output to insure stability. Any increase of this output capacitor larger than 10μF will only improve output impedance.

-C$_{COMP}$ CAPACITOR:

For improved ripple rejection, -Ccomp can be bypassed to ground with a 10μF tantalum capacitor. This bypass capacitor will provide 66dB ripple rejection. Increased capacitance above 10μF does not improve the ripple rejection at frequencies above 120Hz. If the Ccomp bypass capacitor is used, it may be necessary to add a protection diode to protect the regulator from capacitor discharge damage. See Typical Applications Circuit for clarification. If the bypass capacitor is not used, it should be left open since it is internally connected to the regulator.

TYPICAL APPLICATION CIRCUIT

LOAD REGULATION

It is important to keep the output connection between the regulator and the load as short as possible since this directly affects the load regulation. For example, if 20 gauge wire were used which has a resistance of about 0.008 ohms per foot, this would result in a drop of 8mV/ft at 1Amp of load current. It is also important to follow the capacitor selection guidelines to achieve best performance.

HEAT SINKING

To determine if a heat sink is required for your application and if so, what type, refer to the thermal model and governing equation below.

Governing Equation: $Tj = Pd \times (R_{\theta}jc + R_{\theta}cs + R_{\theta}sa) + Ta$

WHERE
Tj = Junction Temperature
Pd = Total Power Dissipation
R$_{\theta}$jc = Junction to Case Thermal Resistance
R$_{\theta}$cs = Case to Heat Sink Thermal Resistance
R$_{\theta}$sa = Heat Sink to Ambient Thermal Resistance
Tc = Case Temperature
Ta = Ambient Temperature
Ts = Heat Sink Temperature

EXAMPLE:

This example demonstrates an analysis where the output currents are at 0.5 amp each and both inputs are 8V.

Conditions for MSK 5911RH:

+Vin = +8.0V; Iout = 0.5A Positive Regulator

1.) Assume 45° heat spreading model.
2.) Find positive regulator power dissipation:

$$Pd = (Vin - Vout)(Iout)$$
$$Pd = (+8V-5V)(0.5A)$$
$$Pd = 1.5W$$

3.) For conservative design, set Tj = +125°C Max.
4.) For this example, worst case Ta = +90°C.
5.) R$_{\theta}$jc = 10.5°C/W from the Electrical Specification Table.
6.) R$_{\theta}$cs = 0.15°C/W for most thermal greases.
7.) Rearrange governing equation to solve for R$_{\theta}$sa:

R$_{\theta}$sa = ((Tj - Ta)/Pd) - (R$_{\theta}$jc) - (R$_{\theta}$cs)
= (125°C-90°C)/1.5W - 10.5°C/W - 0.15°C/W
= 12.7°C/W

The same exercise must be performed for the negative regulator.

TOTAL DOSE RADIATION TEST PERFORMANCE

Radiation performance curves for TID testing have been generated for all radiation testing performed by MS Kennedy. These curves show performance trends throughout the TID test process and can be located in the MSK 5911RH radiation test report. The complete radiation test report is available in the RAD HARD PRODUCTS section on the MSK website.
