White chromaticity	X		$\theta=0°$	0.26	0.31	0.36		Note 7
	Y		$\theta=0°$	0.28	0.33	0.38		

Note 1 : Ambient temperature =25℃, and lamp current I_L = 6 mArms. To be measured in the dark room. DC/AC inverter driving frequency: 70 kHz.

Note 2 :To be measured on the center area of panel with a viewing cone of 1°by Topcon luminance meter BM-5, after 15 minutes operation.

Note 3. Definition of response time:

The output signals of photo detector are measured when the input signals are changed from "black" to "white"(falling time) and from "white" to "black"(rising time), respectively.
The response time is defined as the time interval between the 10% and 90% of amplitudes.   Refer to figure as below.
Note 4. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Photo detector output when LCD is at "White" state}}{\text{Photo detector output when LCD is at "Black" state}}$$

Note 5. White $Vi = V_{i50} + 1.5V$

Black $Vi = V_{i50} \pm 2.0V$

"$\pm$" means that the analog input signal swings in phase with V_{COM} signal.

"$\mp$" means that the analog input signal swings out of phase with V_{COM} signal.

V_{i50} : The analog input voltage when transmission is 50%

The 100% transmission is defined as the transmission of LCD panel when all the input terminals of module are electrically opened.

Note 6. Definition of viewing angle, details please refer to figure as below.
Note 7. Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened.
