1.8V-3.3V PicoPLL™ Programmable Clock

FEATURES

- Advanced One Time Programmable (OTP) PLL design
- Programmable PLL or direct oscillation operation
- Very low Jitter and Phase Noise (30-70ps Pk-Pk typical)
- Output Frequency up to
  - 133MHz @ 1.8V operation
  - 166MHz @ 2.5V operation
  - 200MHz @ 3.3V operation
- Reference Input Frequency: 1MHz to 200MHz
- Accepts >0.1V reference signal input voltage
- Low current consumption, <10µA when PDB is activated
- One programmable I/O pin can be configured as Output Enable (OE),Power Down (PDB) input or an additional clock output (CLK1).
- Frequency Switching (FSEL) capability
- Single 1.8V, 2.5V, or 3.3V ± 10% power supply
- Operating temperature range from -40°C to 85°C
- Available in 6-pin SOT23 and DFN **GREEN**/RoHS compliant packaging

DESCRIPTION

The PL611s-26 is a general purpose frequency synthesizer and a member of PhaseLink's PicoPLL™ product family. Designed to fit in a small 6-pin DFN or 6-pin SOT package for high performance applications, the PL611s-26 offers very low phase noise, jitter, and power consumption, while offering up to 2 clock outputs.. The Frequency Switching (FSEL) capability of PL611s-26 allows for programming two sets of frequencies, while the power down feature of PL611s-26, when activated, allows the IC to consume less than 10µA of power. PL611s-26's programming flexibility allows generating any output using Reference input signal.

FUNCTIONAL DESCRIPTION

PL611s-26 is a highly featured, very flexible, advanced programmable PLL design for high performance, low-power, small form-factor applications. The PL611s-26 accepts a reference clock input of 1MHz to 200MHz and is capable of producing two outputs up to 200MHz. This flexible design allows the PL611s-26 to deliver any PLL generated frequency, FREF (Ref Clk) frequency or FREF /(2*P) to CLK0 and/or CLK1. Some of the design features of the PL611s-26 are mentioned below:

PLL Programming

The PLL in the PL611s-26 is fully programmable. The PLL is equipped with an 8-bit input frequency divider (R-Counter), and an 11-bit VCO frequency feedback loop divider (M-Counter). The output of the PLL is transferred to a 5-bit post VCO divider (P-Counter). The output frequency is determined by the following formula [FOUT = FREF * M / (R * P)].

Clock Output (CLK0)

CLK0 is the main clock output. The PL611s-26 can also be programmed to provide a second clock output, CLK1, on the programmable I/O pin (see OE/PDB/CLK1 pin description below). The output of CLK0 can be configured as the PLL output (F_{VCO}/(2*P)), FREF (Ref Clk Frequency) output, or FREF/(2*P) output. The output drive level can be programmed to Low Drive (4mA), Standard Drive (8mA) or High Drive (16mA). The maximum output frequency is determined by the power supply voltage as shown below:

Clock Output (CLK1)

The CLK1 feature allows the PL611s-26 to have an additional clock output. This output can be programmed to one of the following:

FREF - Reference (Ref Clk) Frequency
FREF / 2
CLK0
CLK0 / 2

Frequency Select (FSEL)

The Frequency Select (FSEL) feature allows the PL611s-26 to switch between two pre-programmed outputs allowing the device “On the Fly” frequency switching. The FSEL pin incorporates a 60kΩ pull up resistor giving a default condition of logic “1”.

Output Enable (OE)

The Output Enable feature allows the user to enable and disable the clock output(s) by toggling the OE pin. The OE pin incorporates a 60kΩ pull up resistor giving a default condition of logic “1”.

Power-Down Control (PDB)

The Power Down (PDB) feature allows the user to put the PL611s-26 into “Sleep Mode”. When activated (logic ‘0’), PDB ‘Disables the PLL, the oscillator circuitry, counters, and all other active circuitry. In Power Down mode the IC consumes <10µA of power. The PDB pin incorporates a 60kΩ pull up resistor giving a default condition of logic “1”.

LAYOUT RECOMMENDATIONS

The following guidelines are to assist you with a performance optimized PCB design:

- Keep all the PCB traces to the PL611s-26 as short as possible, as well as keeping all other traces as far away from it as possible.

- Place a 0.01µF~0.1µF decoupling capacitor between VDD and GND, on the component side of the PCB, close to the VDD pin. It is not recommended to place this component on the backside of the PCB. Going through vias will reduce the signal integrity, causing additional jitter and phase noise.

- It is highly recommended to keep the VDD and GND traces as short as possible.

- When connecting long traces (> 1 inch) to a CMOS output, it is important to design the traces as a transmission line or 'stripline', to avoid reflections or ringing. In this case, the CMOS output needs to be matched to the trace impedance. Usually 'striplines' are designed for 50Ω impedance and CMOS outputs usually have lower than 50 Ω impedance so matching can be achieved by adding a resistor in series with the CMOS output pin to the 'stripline' trace.

- Please contact PhaseLink for additional information on how to design outputs driving long traces or for the Gerber files for the PL611s-26 eval board shown.
