

2-channel 5 Elements Graphic Equalizer IC

Description

The CXA1352AS is a bipolar IC for graphic equalizer use. All controls are DC performed while the addition of single-potentiometers easily composes a 2-channel graphic equalizer.

Features

- Microcomputer control possible
- Built-in electronic volume
- Built-in pseudo loudness function
- Built-in balance function
- Each channel corresponds to 5 elements
- 2 channels of FIX OUT and LINE OUT pins

Applications

Graphic equalizer for cassette tape recorder with radio, mobile stereo and portable stereo

Structure

Bipolar silicon monolithic IC

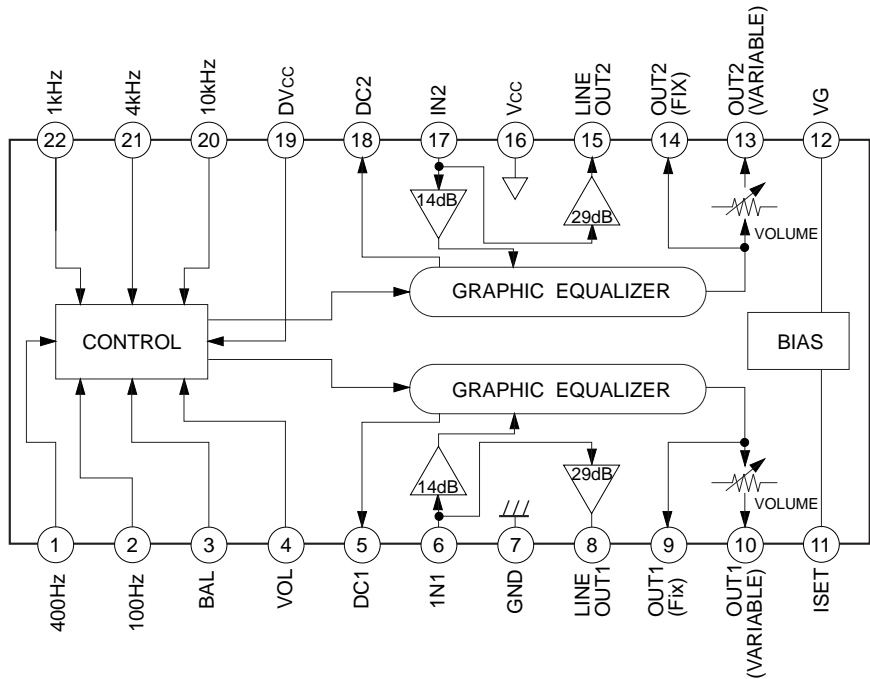

Absolute Maximum Ratings (Ta=25 °C)

• Supply voltage	Vcc	12	V
• Storage temperature	Tstg	-65 to +150	°C
• Allowable power dissipation	Pd	1200	mW

Operating Conditions

• Supply voltage	Vcc	4.0 to 10.0	V
	DVcc	3.5 to Vcc	V
• Operating temperature	Topr	-20 to +75	°C

5	Reference output level	V _{OUT}	Graphic equalizer ALL FLAT, Volume MAX, f=1 kHz	-23.0	-20.0	-17.0	dBm
6	Reference LINE output level	V _{LINE}	f=1 kHz	-6.5	-4.5	-2.5	dBm
7	Reference FIX output level	V _{FIX}	Graphic equalizer ALL FLAT, f=1 kHz	-23.0	-20.0	-17.0	dBm
8	Graphic equalizer setting frequency (1)	GEQ1	LPF cut off frequency (-3 dB)	—	200	—	Hz
9	Graphic equalizer setting frequency (2)	GEQ2	BPF (1) central frequency	—	400	—	Hz
10	Graphic equalizer setting frequency (3)	GEQ3	BPF (2) central frequency	—	1.0	—	kHz
11	Graphic equalizer setting frequency (4)	GEQ4	BPF (3) central frequency	—	4.0	—	kHz
12	Graphic equalizer setting frequency (5)	GEQ5	HPF cut off frequency (-3 dB)	—	8.0	—	kHz
13	Graphic equalizer frequency deviation	Δ EQ	Cut off frequency and central frequency deviation	-20	0	20	%
14	Maximum boost (1)	GEQB1	f=400 Hz, 1 kHz, 4 kHz maximum boost	9.0	11.2	14.0	dB
15	Maximum boost (2)	GEQB2	f=100 Hz, 10 kHz maximum boost	8.0	10.7	14.0	dB
16	Maximum cut (1)	GEQC1	f=400 Hz, 1 kHz, 4kHz maximum cut	-13.0	-10.7	-8.5	dB
17	Maximum cut (2)	GEQC2	f=100 Hz, 10 kHz maximum cut R _L =2 kΩ, Graphic equalizer	-12.0	-9.5	-7.0	dB
18	Total harmonic distortion	THD	ALL FLAT, Volume MAX, f=1 kHz, Reference +10 dB is input	—	0.25	1.0	%
19	Volume attenuation (1)	VOL1	Graphic equalizer ALL FLAT, Volume MAX, f=1 kHz	-1.5	0	1.5	dB
20	Volume attenuation (2)	VOL2	Graphic equalizer ALL FLAT, Volume MIN, f=1 kHz	—	-94.4	-80.0	dB
21	Balance adjustment (1)	BAL1	Graphic equalizer ALL FLAT, BAL=MAX, Volume MAX, f=1kHz	—	0	—	dB
22	Balance adjustment (2)	BAL2	Graphic equalizer ALL FLAT, BAL=MIN, Volume MAX, f=1kHz	—	-66	—	dB
23	Noise level	V _{NOIS}	R _g =5 kΩ, Graphic equalizer ALL FLAT, Volume MAX, "A" WTG filter	—	-93.1	-88.0	dB
24	Output offset voltage	V _{OFF}	Graphic equalizer ALL FLAT, Volume MAX	3.5	4.0	4.5	V

Electrical Characteristics Test Circuit

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

Description of Operation

1. Graphic equalizer

- Conventional system

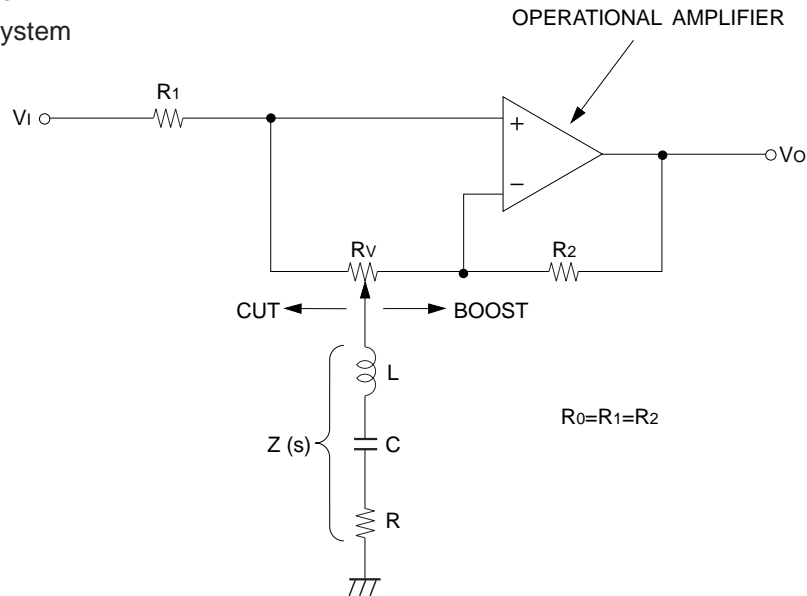

Fig. 1.

Fig. 1. indicates the conventional graphic equalizer system. This circuit performs boost and cut near “fo” controlled by the variable volume Rv. (“fo” is resonance frequency determined by Z (s) (formed LCR).) The operation can be seen as follows : When the LCR circuit goes to the far left of Rv, a state of graphic equalizer becomes maximum cut. At that time, assuming transmittance as T (s), we have

$$T (s) = \frac{Z (s)}{Z (s)+ R_0}$$

Here as $Z (s) = sL+R+ \frac{1}{sC}$

Then $T (s) = \frac{LCs^2+RCs+1}{LCs^2 + (R+R_0) Cs+1}$

Defining fo as $f_0 = \frac{\omega_0}{2\pi}$, ω_0 as $\omega_0 = \frac{1}{LC}$, and Q as $Q = \frac{\omega_0 L}{R}$,

we can obtain the frequency characteristics at cut.

Also, when LCR circuit goes to the far right of Rv, a state of graphic equalizer becomes maximum boost. At that time transmittance is :

$$T (s) = \frac{Z (s) +R_0}{Z (s)} = \frac{LCs^2+ (R+R_0) Cs+1}{LCs^2+RCs+1}$$

Defining fo, ωo and Q as for cut, we can obtain the frequency characteristics at boost.

Fig. 2. Indicates frequency characteristics at boost and cut.

Fig. 2.

- CXA1352AS system

Fig. 3.

The structure of the graphic equalizer used in this IC is shown on Fig. 3. This circuit performs boost and cut controlled by 2 transconductance amplifiers that can vary the conversion coefficient through control currents I_b , and I_c around ω_0 . (“ ω_0 ” is central frequency determined by Band Pass Filter.) Considering output impedance $Z(s)$ of $Gm1$, $Gm2$ we have

$$Z(s) = \frac{1}{H(s) \cdot Gm1}$$

Here, using ω_0 and Q we can express BPF transmittance $H(s)$ as

$$H(s) = \frac{\frac{\omega_0}{Q} \cdot s}{s^2 + \frac{\omega_0}{Q} s + \omega_0^2}$$

$$Z(s) = \frac{Q}{\omega_0 \cdot Gm1} s + \frac{1}{Gm1} + \frac{\omega_0 \cdot Q}{Gm1 \cdot s}$$

This formula shows that this system and the aforementioned LCR circuit have equivalent impedance characteristics on $Z(s)$.

Then, regarding Gm as the maximum value of $Gm1$ and $Gm2$, the operation can be observed as follows. Maximum cut occurs when $Gm1=Gm$ and $Gm2=0$. At that time we have transmittance $T(s)$ as

$$T(s) = \frac{Z(s)}{Z(s) + R} = \frac{s^2 + \frac{\omega_0}{Q} \cdot s + \omega_0^2}{s^2 + \frac{(1+R \cdot Gm) \cdot \omega_0^2}{Q} \cdot s + \omega_0^2}$$

This is equal to the frequency characteristics of the conventional graphic equalizer at cut.

Also, maximum boost occurs when $Gm1=0$ and $Gm2=Gm$. At that time we have transmittance $T(s)$ as

$$T(s) = \frac{Z(s) + R}{Z(s)} = \frac{s^2 + \frac{(1+R \cdot Gm) \cdot \omega_0^2}{Q} \cdot s + \omega_0^2}{s^2 + \frac{\omega_0}{Q} \cdot s + \omega_0^2}$$

This is equal to the frequency characteristics of the conventional graphic equalizer at boost.

We can then deduce that, as far as the operation is concerned the graphic equalizer on this IC and the conventional graphic equalizer are equal, even when the system differs. The merit in using this IC's system rests with the fact that monolithic filter technology realizes a graphic equalizer without external parts.

The structure of the actual graphic equalizer, including BPF, is shown on Fig. 4.

Fig. 4

2. Control through microcomputer possible

Volume, balance and the 100 Hz, 400 Hz, 1 kHz, 4 kHz, 10 kHz boost, cut control respectively are all executed through DC voltage.

Also, the control voltage range is determined through DV_{cc} (control power supply, independent from V_{cc}) and is from 0 V to DV_{cc}. Accordingly, the control range can be varied at will, by changing DV_{cc} voltage. By setting DV_{cc} 5 V, control through the microcomputer becomes possible.

Setting to DV_{cc}=V_{cc} enables usage with single power supply.

3. Pseudo loudness

A loudness function interlocking with volume (VOL) is featured.

With this IC, to provide a loudness effect, the 100 Hz and 10 kHz graphic equalizer part does not use a BPF but is composed of a low pass filter (LPF) and a high pass filter (HPF) respectively.

The operation is explained as follows. As VOL drops below the center, the 100 Hz and 10 kHz graphic equalizer part 1b (See Fig. 3.) gradually increases even if the graphic equalizer control pin (100 Hz and 10 kHz) is flat, boost applies and as a result loudness effect is obtained.

Notes on Operation

1. Power supply

DV_{CC} can be used independently from V_{CC} but supply voltage should be $V_{CC} \geq DV_{CC}$, without fall.

2. Pseudo loudness

As mentioned in the paragraph on Description of Operation, as it is interlocked with VOL, loudness can not be put OFF.

3. Output pin

This IC features 2 channels for each of OUT pin, LINE OUT pin and FIX OUT pin. Usage of the respective output pins is indicated as follows.

- OUT pin
Normally used as the graphic equalizer output.
- LINE OUT pin
A sound from a source that has not passed through the graphic equalizer is only amplified and output from this pin.
- FIX OUT pin
This pin is useful for REC or spectrum analyzer display after the sound formation at the graphic equalizer.

The relation between the input and the respective outputs is shown on Fig. 5.

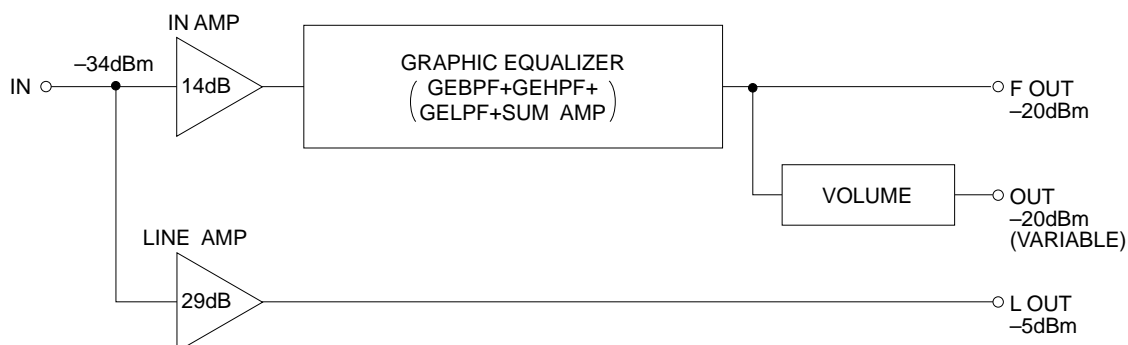

Fig. 5.

4. Reference resistor

To check the central frequency deviation of the graphic equalizer, the control current that determines the filter time constant is determined by means of an external, not an internal, resistor.

This is the 160 k Ω external resistor connected to ISET pin (Pin 11). Accordingly, for the resistor to be connected to ISET pin, it is recommended to use a resistor with excellent dispersion and temperature characteristics.

Also, by varying the value of the resistor connected to ISET pin, the frequency characteristics of the graphic equalizer can be shifted. By reducing the resistor value the shift moves to the high band and by increasing the value the shift moves to the low band.

However, 5 elements cannot be shifted independently.
