2 LTC6410-6
Low Distortion, Low Noise Differential IF Amplifier with Configurable Input Impedance

## feATURES

- 1.4GHz -3dB Bandwidth
- Fixed Voltage Gain of 6 dB ( $50 \Omega$ System)
- Configurable Input Impedance Allows:

Simple Interface to Active Mixers
Improved Noise Performance

- Wide 2.8 V to 5.25 V Supply Range
- Low Distortion:

36dBm OIP3 (70MHz)
33dBm OIP3 (140MHz)
31dBm OIP3 (300MHz)

- Low Noise:
$11 d \mathrm{BFF}\left(50 \Omega \mathrm{Z}_{\mathrm{N}}\right)$
8dB NF ( $200 \Omega \mathrm{Z}_{\text {IN }}$ )
- Differential Inputs and Outputs
- Self-Biasing Inputs/Outputs
- Shutdown Mode
- Minimal Support Circuitry Required
- 16 -Lead $3 \mathrm{~mm} \times 3 \mathrm{~mm} \times 0.8 \mathrm{~mm}$ QFN Package

DESCRIPTIOn

The LTC ${ }^{\circledR} 6410-6$ is a low distortion, low noise differential IF amplifier with configurable input impedance designed for use in applications from DC to 1.4GHz. The LTC6410-6 has 6 dB of voltage gain. The LTC6410-6 is an excellent choice for interfacing active mixers to SAW filters. It features an active input termination that allows a customized input impedance for an optimum interface to differential active mixers. This feature provides additional power gain because of the impedance conversion and improved noise performance when compared to traditional $50 \Omega$ interface circuits. The LTC6410-6 drives a differential $50 \Omega$ Ioad directly with low distortion, which is suitable for driving SAW filters and other $50 \Omega$ signal chain blocks.

The LTC6410-6 operates on 3 V or 5 V supplies. It comes in a compact 16 -lead $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ QFN package and operates over a $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ temperature range.
$\boldsymbol{\Sigma T}$, LT, LTC and LTM are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

## APPLICATIOOS

- Post-Mixer Gain Block
- SAW Filter Interface/Buffering
- Differential IF Signal Chain Gain Block
- Differential Line Driver/Receiver

## TYPICAL APPLICATION

ABSOLUTE MAXIMUM RATINGS
(Note 1)
Total Supply Voltage ( $\mathrm{V}^{+}$to $\mathrm{V}^{-}$) ..... 5.5V
Amplifier Input Current (DC) (+IN, -IN, +TERM, -TERM) ..... $\pm 10 \mathrm{~mA}$
Amplifier Input Power (AC) (+IN, -IN, +TERM, -TERM) ..... 18dBm
Input Current (VBIAS, $\overline{\text { SHDN }}$ ) ..... $\pm 10 \mathrm{~mA}$
Output Current (+OUT, -OUT) ..... $\pm 50 \mathrm{~mA}$
Operating Temperature Range (Note 2).... $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
Specified Temperature Range (Note 3) .... $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
Storage Temperature Range

$\qquad$ .$-65^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$
Junction Temperature ..... $150^{\circ} \mathrm{C}$
Lead Temperature (Soldering, 10 sec ) ..... $300^{\circ} \mathrm{C}$
PIn CONFIGURATION

#  <br> UD PACKAGE <br> 16-LEAD ( $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ ) PLASTIC QFN <br> $T_{\mathrm{JMAX}}=150^{\circ} \mathrm{C}, \theta_{\mathrm{JA}}=68^{\circ} \mathrm{C} / \mathrm{W}, \theta_{\mathrm{JC}}=4.2^{\circ} \mathrm{C} / \mathrm{W}$ <br> EXPOSED PAD (PIN 17) IS V-, MUST BE SOLDERED TO PCB 

## ORDER INFORMATION

| LEAD FREE FINISH | TAPE AND REEL | PART MARKING* | PACKAGE DESCRIPTION | TEMPERATURE RANGE (Notes 2, 3) |

## PIn functions

$\mathbf{V}^{-}$(Pins 1, 4, 9, 12, 17): Negative Power Supply (Normally Tied to Ground). All 5 pins must be tied to the same voltage. $\mathrm{V}^{-}$maybe tied to a voltage other than ground as long as the voltage between $\mathrm{V}^{+}$and $\mathrm{V}^{-}$is 2.8 V to 5.5 V . If the $\mathrm{V}^{-}$pins are not tied to ground, bypass each with 680pF and $0.1 \mu \mathrm{~F}$ capacitors as close to the package as possible.
$V_{\text {BIAS }}$ (Pin 2): This pin sets the input and output common mode voltage by driving the $+\mathbb{I N}$ and $-\operatorname{IN}$ through a buffer with a high output resistance of 1 k . If the part is AC-coupled at the input, the $\mathrm{V}_{\text {BIAS }}$ will set the $\mathrm{V}_{\text {INCM }}$ and therefore the $\mathrm{V}_{\text {OUTCM }}$ voltage. If the part is DC-coupled at the input, $\mathrm{V}_{\text {BIAS }}$ should be left floating. Internal resistors bias $\mathrm{V}_{\text {BIAS }}$ to 1.4 V on a 3 V supply.

V+ (Pins 3, 5, 8, 10): Positive Power Supply. All 4 pins must be tied to the same voltage. Split supplies are possible as long as the voltage between $\mathrm{V}^{+}$and $\mathrm{V}^{-}$is 2.8 V to 5.5 V . Bypass capacitors of 680 pF and $0.1 \mu \mathrm{~F}$ as close to the part as possible should be used between supplies.
+OUT, -OUT (Pins 6, 7): Outputs. These pins each have internal series termination resistors forming a differential output resistance.
$\overline{\text { SHDN }}$ (Pin 11): This pin is internally pulled high by a typically 30 k resistor to $\mathrm{V}^{+}$. By pulling this pin low the supply current will be reduced to typically 3 mA . See DC Electrical Characteristics table for the specific logic levels.
-TERM (Pin 13): Negative Input Termination. When tied directly to $-\operatorname{IN}$, it provides an active $50 \Omega$ differential termination when +TERM is also tied directly to + IN.
-IN (Pin 14): Negative Input. This pin is normally tied to -TERM, the input termination pin. If AC-coupled, this pin will self bias by $\mathrm{V}_{\text {BIAS }}$.
+IN (Pin 15): Positive Input. This pin is normally tied to +TERM, the input termination pin. If AC-coupled, this pin will self bias by $\mathrm{V}_{\text {BIAS }}$.
+TERM (Pin 16): Positive Input Termination. When tied directly to $+\mathbb{N}$, it provides an active $50 \Omega$ differential termination when -TERM is also tied directly to -IN.

Exposed Pad (Pin 17): $\mathrm{V}^{-}$. The Exposed Pad must be soldered to the PCB metal.

## BLOCK DIAGRAM

## APPLICATIONS INFORMATION

## Introduction

The LTC6410-6 is a low noise differential high speed amplifier. By default, the LTC6410-6 has 6dB voltage gain and is designed to operate with $50 \Omega$ differential input and output impedances. By changing ( REXT ), alternative configurations provide input resistances of up to $400 \Omega$, with correspondingly lower noise figure and higher power gain. The Block Diagram shows the basic circuit along with key external components while Table 1 provides configuration information. If the input is AC -coupled, the $\mathrm{V}_{\text {BIAS }}$ pin sets the input common mode voltage and therefore the output common mode voltage.

## Input Impedance

LTC6410-6 has been designed with very flexible input termination circuitry. By default, with the termination pins connected directly to the inputs, the input impedance is $58 \Omega$, see the Block Diagram. Internally, there is $110 \Omega$ between each input and the opposite output ( $\mathrm{R}_{\mathrm{T}}$ ). Dividing the resistor by the internal noise gain of $2.7+1=3.7$, $29.5 \Omega$ input impedance is created ( $59 \Omega$ differential ). In parallel with the $2 k$ common mode resistance, a total of $58 \Omega$ differential input impedance is achieved. This method of termination is used to provide lower noise figure through the use of feedback which reduces the effective noise of the termination resistor. By adding additional resistance in series with the termination pins, higher input impedances can be obtained (see Table 1). The optimum impedance for minimizing the noise figure of the LTC6410-6 is close to $400 \Omega$. Because the amplifier is inherently a voltage amplifier, the difference between the impedance at the input and the output adds additional power gain as can be seen in Table 1. These higher impedance levels can be useful in interfacing with active mixers which can have output impedance of $400 \Omega$ and beyond.

## Input and Output Common Mode Bias

The LTC6410-6 is internally self-biased through the $\mathrm{V}_{\text {BIAS }}$ pin (see the Block Diagram). Therefore the LTC6410-6 can be AC-coupled with no external biasing circuitry. The
output will have approximately the same common mode voltage as the input.

In the case of a DC-coupled input connection, the input DC common mode voltage will also set the output common mode voltage. Note that a voltage divider is formed between the $V_{\text {BIAS }}$ buffer output and the DC input source impedance.

The $\bigvee_{\text {BIAS }}$ pin has an internal voltage divider which will self bias to approximately 1.4 V on a 3 V supply ( 0.47 • $V_{\text {SUPPLY }}$. An external capacitor of $0.1 \mu \mathrm{~F}$ to ground is recommended to bypass the pin. The resistance of the pin is 3 k . See Distortion vs Common Mode graph.

For increased common mode accuracy, the +TERM and -TERM pins can be AC-coupled to the inputs with capacitors ( $\mathrm{C}_{\text {EXT }}$ ). This coupling prevents the feedback from the termination resistance from creating additional DC common mode voltage error. The $G_{C M}$ and $V_{\text {OSCM }}$ of the DC Electrical Characteristics table reflect the less accurate DC-coupled scenario.

The termination inputs are part of a high speed feedback loop. The physical length of the termination loop ( $\mathrm{R}_{\mathrm{EXT}}$ and $\mathrm{C}_{\mathrm{EXT}}$ ) must be minimized to maintain stability and minimize gain peaking.

## Gain

Internally, the LTC6410-6 has a voltage gain of $2.7 \mathrm{~V} / \mathrm{V}$. The default source and load resistances in most of the data sheet are assumed to be $50 \Omega$ differential. Due to the input and output resistance of the LTC6410-6 being $58 \Omega$ and $22 \Omega$ respectively, the overall voltage gain in a $50 \Omega$ system is $6 \mathrm{~dB}(2 \mathrm{~V} / \mathrm{V})$. Other source and load resistances will produce different gains due to the resistive dividers. Figure 1 is a system diagram for calculating gain.

Figure 1

## APPLICATIONS InFORMATION

Therefore the differential voltage gain can be calculated as follows:

$$
\text { Voltage Gain }=2 \cdot \frac{R_{I N}}{R_{I N}+R_{S}} \cdot 2.7 \cdot \frac{R_{L}}{R_{L}+R_{0 U T}}
$$

The following is an example of the $50 \Omega$ gain calculation:

$$
\begin{aligned}
\text { Voltage Gain } & =2 \cdot \frac{58}{58+50} \cdot 2.7 \cdot \frac{50}{50+22} \\
& =2.0 \mathrm{~V} / \mathrm{V}=6.0 \mathrm{~dB}
\end{aligned}
$$

The part also can be used with different input impedances providing no additional voltage gain, but a higher power gain.

For example, the calculation for a $100 \Omega$ input impedance shows the effect of an impedance conversion. The voltage gain is calculated as follows:

$$
\begin{aligned}
\text { Voltage Gain } & =2 \cdot \frac{83}{83+100} \cdot 2.7 \cdot \frac{50}{50+22} \\
& =1.7 \mathrm{~V} / \mathrm{V}=4.6 \mathrm{~dB}
\end{aligned}
$$

However the power gain is:

$$
\begin{aligned}
\text { Power Gain } & =\left(2 \cdot \frac{83}{83+100} \cdot 2.7 \cdot \frac{50}{50+22} \cdot \sqrt{2}\right)^{2} \\
& =5.8 \mathrm{~mW} / \mathrm{mW}=7.6 \mathrm{~dB}
\end{aligned}
$$

## Output Impedance

The LTC6410-6 is designed to drive a differential load of $50 \Omega$ with a total differential output resistance of $22 \Omega$. While the LTC6410-6 can source and sink approximately 50 mA , large DC output current should be avoided. To test the part on traditional $50 \Omega$ test equipment, $A C$ coupling or balun transformers (or both) may be necessary at the input and output.

## Supply Rails

Inductance in the supply path can severely effect the performance of the LTC6410-6. Therefore it is recommended that low inductance bypass capacitors are installed very close to the part. 680pF and $0.1 \mu \mathrm{~F}$ sized capacitors are recommended. Additionally, the exposed pad of the part must be connected to $\mathrm{V}^{-}$for low inductance and low thermal resistance. Failure to provide a low impedance supply at high frequencies can cause oscillations and increased distortion.

## SHDN

The $\overline{\text { SHDN }}$ pin self-biases to $\mathrm{V}^{+}$through a 30k resistor. The pin must be pulled below 0.8 V in order to shut down the part.

## Applications Circuits

The graphs on the following page are examples of the four differential input resistances used on the DC1103A demo board with balun transformers for interfacing with the $50 \Omega$ single-ended measurement equipment.

## TYPICAL APPLICATION

SAW Filter Application

The schematic above shows a typical signal chain application with the LTC6410-6 in combination with a 140 MHz center frequency 24 MHz bandwidth SAW filter. Without the LTC6410-6, the attenuation of the SAW would be -11.5 dB . The networks between the LTC6410-6 and the SAW filter, and after the SAW filterare for proper impedance matching.

The differential output of the LTC6410-6 allows differential driving of the SAW filter without the need for a transformer. The differential nature of the LTC6410-6 allows for ease of use in differential signal chains, and may reduce the need for transformers.
