

BUD42D

High Speed, High Gain Bipolar NPN Transistor with Antisaturation Network and Transient Voltage Suppression Capability

The BUD42D is a state-of-the-art bipolar transistor. Tight dynamic characteristics and lot to lot minimum spread make it ideally suitable for light ballast applications.

Features

- Free-Wheeling Diode Built-In
- Flat DC Current Gain
- Fast Switching Times and Tight Distribution
- “6 Sigma” Process Providing Tight and Reproducible Parameter Spreads
- Epoxy Meets UL 94 V-0 @ 0.125 in
- ESD Ratings: Machine Model, C; >400 V
Human Body Model, 3B; >8000 V
- Pb-Free Packages are Available

Two Versions

- BUD42D-1: Case 369D for Insertion Mode
- BUD42D, BUD42DT4: Case 369C for Surface Mount Mode

MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Collector-Emitter Sustaining Voltage	V_{CEO}	350	Vdc
Collector-Base Breakdown Voltage	V_{CBO}	650	Vdc
Collector-Emitter Breakdown Voltage	V_{CES}	650	Vdc
Emitter-Base Voltage	V_{EBO}	9	Vdc
Collector Current – Continuous	I_C	4.0	Adc
– Peak (Note 1)	I_{CM}	8.0	
Base Current – Continuous	I_B	1.0	Adc
– Peak (Note 1)	I_{BM}	2.0	
Total Device Dissipation @ $T_C = 25^\circ\text{C}$	P_D	25	W
Derate above 25°C		0.2	W/ $^\circ\text{C}$
Operating and Storage Temperature	T_J, T_{stg}	-65 to +150	$^\circ\text{C}$

TYPICAL GAIN

Typical Gain @ $I_C = 1\text{ A}, V_{CE} = 2\text{ V}$	h_{FE}	13	–
Typical Gain @ $I_C = 0.3\text{ A}, V_{CE} = 1\text{ V}$	h_{FE}	16	–

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

MAXIMUM RATINGS

Figure 28. Forward Bias Safe Operating Area

Figure 29. Reverse Bias Safe Operating Area

Figure 30. Power Derating

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate I_C - V_{CE} limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate. The data of Figure 28 is based on $T_C = 25^\circ\text{C}$; $T_{j(pk)}$ is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10% but must be derated when $T_C > 25^\circ\text{C}$. Second Breakdown limitations do not derate like thermal limitations. Allowable current at the voltages shown on

Figure 28 may be found at any case temperature by using the appropriate curve on Figure 30.

$T_{j(pk)}$ may be calculated from the data in Figure 31. At any case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by second breakdown. For inductive loads, high voltage and current must be sustained simultaneously during turn-off with the base to emitter junction reverse biased. The safe level is specified as reverse biased safe operating area (Figure 29). This rating is verified under clamped conditions so that the device is never subjected to an avalanche mode.
