DRC
Digital Reality Creation

DRC™ Digital Reality Creation™ Multi-function analyzes a 480i NTSC image and creates a digital bit mapped pattern in real time. The original NTSC signal is mapped in real time, replaced with an HD representative and then discarded. Because DRC™ processes video signals in real time, it creates an image with 4X the density of the original signal. Resolution is increased both vertically and horizontally.

CineMotion™ Reverse 3-2 Pulldown improves the display of video programs originally shot on 24 frames per second film preserving the integrity of the original film frames for more fluid motion and more fine detail.

*All Sony digital still cameras and camcorders except models DSCD-700, DSCD-770, DCR-TRV900 and DSR-PD100A store images on a Memory Stick in the DCF file format, which is required for playback on these projectors. If the image file is renamed or manipulated, the DCF file format must be restored before playback is possible. Images captured on all other digital still cameras and camcorders will need to be formatted on a PC to the DCF file format (with third party software not supplied with the projector) before they can be viewed.
