# MAX17600-MAX17605 

## 4A Sink/Source Current, $12 n s$, Dual MOSFET Drivers

## General Description

The MAX17600-MAX17605 devices are high-speed MOSFET drivers capable of sinking/sourcing 4A peak currents. The devices have various inverting and noninverting part options that provide greater flexibility in controlling the MOSFET. The devices have internal logic circuitry that prevents shoot-through during output-state changes. The logic inputs are protected against voltage spikes up to +14 V , regardless of VDD voltage. Propagation delay time is minimized and matched between the dual channels. The devices have very fast switching time, combined with short propagation delays (12ns typ), making them ideal for high-frequency circuits. The devices operate from $\mathrm{a}+4 \mathrm{~V}$ to +14 V single power supply and typically consume 1 mA of supply current. The MAX17600/MAX17601 have standard TTL input logic levels, while the MAX17603/MAX17604/ MAX17605 have CMOS-like high-noise margin (HNM) input logic levels. The MAX17600/MAX17603 are dual inverting input drivers, the MAX17601/MAX17604 are dual noninverting input drivers, and the MAX17602/ MAX17605 devices have one noninverting and one inverting input. These devices are provided with enable pins (ENA, ENB) for better control of driver operation.
These devices are available in 8 -pin ( $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ ) TDFN, 8 -pin ( $3 \mathrm{~mm} \times 5 \mathrm{~mm}$ ) $\mu \mathrm{MAX}{ }^{\circledR}$, and 8-pin SO packages and operate over the $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ temperature range.

## Applications

Power MOSFET Switching
Switch-Mode Power Supplies
DC-DC Converters
Motor Control
Power-Supply Modules

Ordering Information appears at end of data sheet.

## Typical Operating Circuit

## MAX17600-MAX17605

## 4A Sink/Source Current, $12 n s$, Dual MOSFET Drivers

## ABSOLUTE MAXIMUM RATINGS

Operating Temperature Range ........................ $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
Junction Temperature ................................................... $+150^{\circ} \mathrm{C}$
Storage Temperature Range............................ $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Lead Temperature (soldering, 10s) ................................ $+300^{\circ} \mathrm{C}$
Soldering Temperature (reflow) ..................................... $+240^{\circ} \mathrm{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## PACKAGE THERMAL CHARACTERISTICS (Note 1)

| TDFN |  |
| :---: | :---: |
| Junction-to-Ambient Thermal Resistance ( $\theta_{\mathrm{JA}}$ ) | $42^{\circ} \mathrm{C} / \mathrm{W}$ |
| Junction-to-Case Thermal Resistance ( $\theta_{\mathrm{JC}}$ ) | $8^{\circ} \mathrm{C} / \mathrm{W}$ |
| SO |  |
| Junction-to-Ambient Thermal Resistance ( $\theta_{\text {JA }}$ ) | $136^{\circ} \mathrm{C} / \mathrm{W}$ |
| Junction-to-Case Thermal Resistance ( $\theta_{\mathrm{Jc}}$ ) . | . $38^{\circ} \mathrm{C} / \mathrm{W}$ |

$\mu \mathrm{MAX}$
Junction-to-Ambient Thermal Resistance $\left(\theta_{\mathrm{JA}}\right)$....... $77.6^{\circ} \mathrm{C} / \mathrm{W}$ Junction-to-Case Thermal Resistance ( $\theta_{\mathrm{JC}}$ ) ................. $5^{\circ} \mathrm{C} / \mathrm{W}$

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a fourlayer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

Pin Configurations

Pin Description

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| 1 | ENA | Enable Input for Driver A. Internally pulled to VDD through a $100 \mathrm{k} \Omega$ resistor. Leave unconnected for always-on operation. Connect to GND for disabling the corresponding channel. |
| 2 | INA | Logic Input for Channel A |
| 3 | GND | Ground |
| 4 | INB | Logic Input for Channel B |
| 5 | OUTB | Channel B Driver Output. Sources and sinks current for channel B to turn the external MOSFET at OUTB on or off. |
| 6 | $V_{D D}$ | Power-Supply Input. Bypass to GND with one or more low-ESR $0.1 \mu \mathrm{~F}$ ceramic capacitors. |
| 7 | OUTA | Channel A Driver Output. Sources and sinks current for channel A to turn the external MOSFET at OUTA on or off. |
| 8 | ENB | Enable Input for Driver B. Internally pulled to $\mathrm{V}_{\mathrm{DD}}$ through a $100 \mathrm{k} \Omega$ resistor. Leave unconnected for always-on operation. Connect to GND for disabling the corresponding channel. |
| - | EP | Exposed Pad (TDFN Only). Internally connected to GND. Do not use the EP as the only ground connection. |

## Detailed Description

The MAX17600-MAX17605 are high-speed MOSFET drivers capable of sinking/sourcing 4A peak currents. The devices have various inverting and noninverting part options that provide greater flexibility in controlling the MOSFET. The devices have internal logic circuitry that prevents shoot-through during output-state changes. The logic inputs are protected against voltage spikes up to +16 V , regardless of $\mathrm{V}_{\mathrm{DD}}$ voltage. Propagation delay time is minimized and matched between the dual channels. The devices have very fast switching time, combined with short propagation delays (12ns typ), making them ideal for high-frequency circuits. The devices operate from $\mathrm{a}+4 \mathrm{~V}$ to +14 V single power supply and typically consume 1 mA of supply current. The MAX17600/MAX17601/MAX17602 have standard TTL input logic levels, while the MAX17603/MAX17604/ MAX17605 have CMOS-like high-noise margin (HNM) input logic levels. The MAX17600/MAX17603 are dual inverting input drivers, the MAX17601/MAX17604 are dual noninverting input drivers, and the MAX17602/ MAX17605 have one noninverting and one inverting input. These devices are provided with enable pins (ENA and ENB) for better control of driver operation.

## Logic Inputs

The MAX17600/MAX17601/MAX17602 have standard TTL input logic levels, while the MAX17603/MAX17604/ MAX17605 have CMOS-like HNM input logic levels (see the Electrical Characteristics table). Table 1 gives the truth table for various part options.

## MAX17600-MAX17605

## 4A Sink/Source Current, 12ns, Dual MOSFET Drivers

#### Abstract

Undervoltage Lockout (UVLO) When $V_{D D}$ is below the UVLO threshold, the output stage n -channel device is on and the p-channel is off, independent of the state of the inputs. This holds the outputs low. The UVLO is typically 3.6 V with 200 mV typical hysteresis to avoid chattering. A typical falling delay of $2 \mu$ s makes the UVLO immune to narrow negative transients in noisy environments.

## Driver Outputs

The devices feature 4A peak sourcing/sinking capabilities to provide fast rise and fall times of the MOSFET gate. Add a resistor in series with OUT_ to slow the corresponding rise/fall time of the MOSFET gate.

## Applications Information

Supply Bypassing, Device Grounding, and Placement
Ample supply bypassing and device grounding are extremely important because when large external capacitive loads are driven, the peak current at the $V_{D D}$ pin can approach 4A, while at the GND pin, the peak current can approach 4A. VDD drops and ground shifts are forms of negative feedback for inverters and, if excessive, can cause multiple switching when the inverting input is used and the input slew rate is low. The device driving the input should be referenced to the devices' GND pin, especially when the inverting input is used. Ground shifts due to insufficient device grounding can disturb other circuits sharing the same AC ground return path. Any series inductance in the VDD, OUT_, and/or GND paths can cause oscillations due to the very high di/dt that results when the devices are switched with any capacitive load. A $2.2 \mu \mathrm{~F}$ or larger value ceramic capacitor is recommended, bypassing VDD to GND and placed as close as possible to the pins. When driving very large loads (e.g., 10nF) at minimum rise time, 10 FF or more of parallel storage capacitance is recommended. A ground plane is highly recommended to minimize ground return resistance and series inductance. Care should be taken to place the devices as close as possible to the external MOSFET being driven to further minimize board inductance and AC path resistance.

Power Dissipation
Power dissipation of the devices consists of three components, caused by the quiescent current, capacitive charge and discharge of internal nodes, and the output current (either capacitive or resistive load). The sum of
these components must be kept below the maximum power-dissipation limit.
The quiescent current is 1 mA typical. The current required to charge and discharge the internal nodes is frequency dependent (see the Typical Operating Characteristics). The devices' power dissipation when driving a ground referenced resistive load is:

$$
P=D \times R_{O N}(M A X) \times I_{\text {LOAD } 2} \text { per channel }
$$

where D is the fraction of the period the devices' output pulls high, RON (MAX) is the maximum pullup on-resistance of the device with the output high, and ILOAD is the output load current of the devices.
For capacitive loads, the power dissipation is:

$$
P=C_{L O A D} \times\left(V_{D D}\right)^{2} \times F R E Q \text { per channel }
$$

where CLOAD is the capacitive load, VDD is the supply voltage, and FREQ is the switching frequency.

## Layout Information

The devices' MOSFET drivers source and sink large currents to create very fast rise and fall edges at the gate of the switching MOSFET. The high di/dt can cause unacceptable ringing if the trace lengths and impedances are not well controlled. The following PCB layout guidelines are recommended when designing with the devices:

- Place at least one $2.2 \mu \mathrm{~F}$ decoupling ceramic capacitor from VDD to GND as close as possible to the IC. At least one storage capacitor of $10 \mu \mathrm{~F}(\mathrm{~min})$ should be located on the PCB with a low-resistance path to the VDD pin of the devices. There are two AC current loops formed between the IC and the gate of the MOSFET being driven. The MOSFET looks like a large capacitance from gate to source when the gate is being pulled low. The active current loop is from OUT_ of the devices to the MOSFET gate to the MOSFET source and to GND of the devices. When the gate of the MOSFET is being pulled high, the active current loop is from OUT_ of the devices to the MOSFET gate to the MOSFET source to the GND terminal of the decoupling capacitor to the VDD terminal of the decoupling capacitor and to the VDD terminal of the devices. While the charging current loop is important, the discharging current loop is also critical. It is important to minimize the physical distance and the impedance in these AC current paths.
- In a multilayer PCB, the component surface layer surrounding the devices should consist of a ground plane containing the discharging and charging current loops.

| MAX17604AUA+ | 8 MMAX-EP* | Dual/Noninverting | HNM | +AACM |
| MAX17605ATA+ | 8 TDFN-EP* (3mm x 3mm) | Inverting/Noninverting | HNM | +BOO |
| MAX17605ASA+ | 8 SO | Inverting/Noninverting | HNM | + |
| MAX17605AUA+ | $8 \mu \mathrm{MAX}$-EP* | Inverting/Noninverting | HNM | +AACN |

Note: All devices are specified over the $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ temperature range. Optional 8-pin $2 \mathrm{~mm} \times 3 \mathrm{~mm}$ TDFN package is available. Contact your Maxim sales representative for more information.
+Denotes a lead(Pb)-free/RoHS-compliant package.
*EP = Exposed pad.

## Chip Information

PROCESS: BiCMOS

Package Information
For the latest package outline information and land patterns (footprints), go to www.maxim-ic.com/packages. Note that a "+", "\#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

| PACKAGE <br> TYPE | PACKAGE <br> CODE | OUTLINE <br> NO. | LAND <br> PATTERN NO. |
| :---: | :---: | :---: | :---: |
| 8 TDFN-EP | $\mathrm{T} 833+2$ | $\underline{\mathbf{2 1 - 0 1 3 7}}$ | $\underline{90-0059}$ |
| 8 SO | $\mathrm{S} 8+2$ | $\underline{\mathbf{2 1 - 0 0 4 1}}$ | $\underline{90-0096}$ |
| $8 \mu \mathrm{MAX}$ | $\mathrm{U} 8 \mathrm{E}+2$ | $\underline{\underline{21-0107}}$ | $\underline{90-0145}$ |

# 4A Sink/Source Current, 12ns, Dual MOSFET Drivers 

Revision History

| REVISION <br> NUMBER | REVISION <br> DATE | DESCRIPTION | PAGES <br> CHANGED |
| :---: | :---: | :--- | :---: |
| 0 | $1 / 12$ | Initial release | - |
| 1 | $5 / 12$ | Added the MAX17600 | $1-12$ |
