Introduction

The Spartan®-3A family of Field-Programmable Gate Arrays (FPGAs) solves the design challenges in most high-volume, cost-sensitive, I/O-intensive electronic applications. The five-member family offers densities ranging from 50,000 to 1.4 million system gates, as shown in [Table 1](#).

The Spartan-3A family builds on the success of the earlier Spartan-3E and Spartan-3 FPGA families by increasing the amount of I/O per logic, significantly reducing the cost per I/O. New features improve system performance and reduce the cost of configuration. These Spartan-3A family enhancements, combined with proven 90 nm process technology, deliver more functionality and bandwidth per dollar than ever before, setting the new standard in the programmable logic industry.

Because of their exceptionally low cost, Spartan-3A FPGAs are ideally suited to a wide range of consumer electronics applications, including broadband access, home networking, display/projection, and digital television equipment.

The Spartan-3A family is a superior alternative to mask programmed ASICs. FPGAs avoid the high initial cost, lengthy development cycles, and the inherent inflexibility of conventional ASICs, and permit field design upgrades.

Features

- Very low cost, high-performance logic solution for high-volume, cost-conscious applications
- Dual-range V_{CCAUX} supply simplifies 3.3V-only design
- Suspend, Hibernate modes reduce system power
- Multi-voltage, multi-standard SelectIO™ interface pins
 - ◆ Up to 502 I/O pins or 227 differential signal pairs
 - ◆ LVCMOS, LVTTTL, HSTL, and SSTL single-ended I/O
 - ◆ 3.3V, 2.5V, 1.8V, 1.5V, and 1.2V signaling
 - ◆ Selectable output drive, up to 24 mA per pin
 - ◆ QUIETIO standard reduces I/O switching noise
 - ◆ Full 3.3V ± 10% compatibility and hot swap compliance

- ◆ 640+ Mb/s data transfer rate per differential I/O
- ◆ 750 Mb/s rate using SCD 4103
- ◆ LVDS, RSDS, mini-LVDS, HSTL/SSTL differential I/O with integrated differential termination resistors
- ◆ Enhanced Double Data Rate (DDR) support
- ◆ DDR/DDR2 SDRAM support up to 400 Mb/s
- ◆ Fully compliant 32-/64-bit, 33/66 MHz PCI® technology support
- Abundant, flexible logic resources
 - ◆ Densities up to 25,344 logic cells, including optional shift register or distributed RAM support
 - ◆ Efficient wide multiplexers, wide logic
 - ◆ Fast look-ahead carry logic
 - ◆ Enhanced 18 x 18 multipliers with optional pipeline
 - ◆ IEEE 1149.1/1532 JTAG programming/debug port
- Hierarchical SelectRAM™ memory architecture
 - ◆ Up to 576 Kbits of fast block RAM with byte write enables for processor applications
 - ◆ Up to 176 Kbits of efficient distributed RAM
- Up to eight Digital Clock Managers (DCMs)
 - ◆ Clock skew elimination (delay locked loop)
 - ◆ Frequency synthesis, multiplication, division
 - ◆ High-resolution phase shifting
 - ◆ Wide frequency range (5 MHz to over 320 MHz)
- Eight low-skew global clock networks, eight additional clocks per half device, plus abundant low-skew routing
- Configuration interface to industry-standard PROMs
 - ◆ Low-cost, space-saving SPI serial Flash PROM
 - ◆ x8 or x8/x16 parallel NOR Flash PROM
 - ◆ Low-cost Xilinx® Platform Flash with JTAG
 - ◆ Unique Device DNA identifier for design authentication
 - ◆ Load multiple bitstreams under FPGA control
- Complete Xilinx ISE® and WebPACK™ development system software support plus [Spartan-3A Starter Kit](#)
- [MicroBlaze™](#) and [PicoBlaze™](#) embedded processors
- Low-cost QFP and BGA packaging, Pb-free options
 - ◆ Common footprints support easy density migration
 - ◆ Compatible with select [Spartan-3AN](#) nonvolatile FPGAs
 - ◆ Compatible with higher density [Spartan-3A DSP](#) FPGAs
- [XA Automotive](#) version available

Architectural Overview

The Spartan-3A family architecture consists of five fundamental programmable functional elements:

- **Configurable Logic Blocks (CLBs)** contain flexible Look-Up Tables (LUTs) that implement logic plus storage elements used as flip-flops or latches. CLBs perform a wide variety of logical functions as well as store data.
- **Input/Output Blocks (IOBs)** control the flow of data between the I/O pins and the internal logic of the device. IOBs support bidirectional data flow plus 3-state operation. Supports a variety of signal standards, including several high-performance differential standards. Double Data-Rate (DDR) registers are included.
- **Block RAM** provides data storage in the form of 18-Kbit dual-port blocks.
- **Multiplier Blocks** accept two 18-bit binary numbers as inputs and calculate the product.

- **Digital Clock Manager (DCM) Blocks** provide self-calibrating, fully digital solutions for distributing, delaying, multiplying, dividing, and phase-shifting clock signals.

These elements are organized as shown in [Figure 1](#). A dual ring of staggered IOBs surrounds a regular array of CLBs. Each device has two columns of block RAM except for the XC3S50A, which has one column. Each RAM column consists of several 18-Kbit RAM blocks. Each block RAM is associated with a dedicated multiplier. The DCMs are positioned in the center with two at the top and two at the bottom of the device. The XC3S50A has DCMs only at the top, while the XC3S700A and XC3S1400A add two DCMs in the middle of the two columns of block RAM and multipliers.

The Spartan-3A family features a rich network of routing that interconnect all five functional elements, transmitting signals among them. Each functional element has an associated switch matrix that permits multiple connections to the routing.

Notes:

1. The XC3S700A and XC3S1400A have two additional DCMs on both the left and right sides as indicated by the dashed lines. The XC3S50A has only two DCMs at the top and only one Block RAM/Multiplier column.

Figure 1: Spartan-3A Family Architecture

Configuration

Spartan-3A FPGAs are programmed by loading configuration data into robust, reprogrammable, static CMOS configuration latches (CCLs) that collectively control all functional elements and routing resources. The FPGA's configuration data is stored externally in a PROM or some other non-volatile medium, either on or off the board. After applying power, the configuration data is written to the FPGA using any of seven different modes:

- Master Serial from a [Xilinx Platform Flash PROM](#)
- Serial Peripheral Interface (SPI) from an industry-standard SPI serial Flash
- Byte Peripheral Interface (BPI) Up from an industry-standard x8 or x8/x16 parallel NOR Flash
- Slave Serial, typically downloaded from a processor
- Slave Parallel, typically downloaded from a processor
- Boundary Scan (JTAG), typically downloaded from a processor or system tester

Furthermore, Spartan-3A FPGAs support MultiBoot configuration, allowing two or more FPGA configuration bitstreams to be stored in a single SPI serial Flash or a parallel NOR Flash. The FPGA application controls which configuration to load next and when to load it.

Additionally, each Spartan-3A FPGA contains a unique, factory-programmed Device DNA identifier useful for tracking purposes, anti-cloning designs, or IP protection.

Notes:

1. The number shown in **bold** indicates the maximum number of I/O and input-only pins. The number shown in *italics* indicates the number of input-only pins. The differential (Diff) input-only pin count includes both differential pairs on input-only pins and differential pairs on I/O pins within I/O banks that are restricted to differential inputs.

I/O Capabilities

The Spartan-3A FPGA SelectIO interface supports many popular single-ended and differential standards. [Table 2](#) shows the number of user I/Os as well as the number of differential I/O pairs available for each device/package combination. Some of the user I/Os are unidirectional input-only pins as indicated in [Table 2](#).

Spartan-3A FPGAs support the following single-ended standards:

- 3.3V low-voltage TTL (LVTTTL)
- Low-voltage CMOS (LVCMOS) at 3.3V, 2.5V, 1.8V, 1.5V, or 1.2V
- 3.3V PCI at 33 MHz or 66 MHz
- HSTL I, II, and III at 1.5V and 1.8V, commonly used in memory applications
- SSTL I and II at 1.8V, 2.5V, and 3.3V, commonly used for memory applications

Spartan-3A FPGAs support the following differential standards:

- LVDS, mini-LVDS, RSDS, and PPDS I/O at 2.5V or 3.3V
- Bus LVDS I/O at 2.5V
- TMDS I/O at 3.3V
- Differential HSTL and SSTL I/O
- LVPECL inputs at 2.5V or 3.3V

Production Status

Table 3 indicates the production status of each Spartan-3A FPGA by temperature range and speed grade. The table also lists the earliest speed file version required for creating

a production configuration bitstream. Later versions are also supported.

Table 3: Spartan-3A FPGA Family Production Status (Production Speed File)

Package Marking

Figure 2 provides a top marking example for Spartan-3A FPGAs in the quad-flat packages. Figure 3 shows the top marking for Spartan-3A FPGAs in BGA packages. The markings for the BGA packages are nearly identical to those

for the quad-flat packages, except that the marking is rotated with respect to the ball A1 indicator.

The “5C” and “4I” Speed Grade/Temperature Range part combinations may be dual marked as “5C/4I”.

Ordering Information

Spartan-3A FPGAs are available in both standard and Pb-free packaging options for all device/package combinations. The Pb-free packages include a 'G' character in the ordering code.

Standard Packaging

Pb-Free Packaging

| Device | Speed Grade | Package Type / Number of Pins | | Temperature Range (T_J) |
|-----------|-------------------------|-------------------------------|--|---|
| XC3S50A | -4 Standard Performance | VQ(G)100 | 100-pin Very Thin Quad Flat Pack (VQFP) | C Commercial (0°C to 85°C) |
| XC3S200A | -5 High Performance | TQ(G)144 | 144-pin Thin Quad Flat Pack (TQFP) | I Industrial (-40°C to 100°C) |
| XC3S400A | | FT(G)256 | 256-ball Fine-Pitch Thin Ball Grid Array (FTBGA) | |
| XC3S700A | | FG(G)320 | 320-ball Fine-Pitch Ball Grid Array (FBGA) | |
| XC3S1400A | | FG(G)400 | 400-ball Fine-Pitch Ball Grid Array (FBGA) | |
| | | FG(G)484 | 484-ball Fine-Pitch Ball Grid Array (FBGA) | |
| | | FG(G)676 | 676-ball Fine-Pitch Ball Grid Array (FBGA) | |

Notes:

1. The -5 speed grade is exclusively available in the Commercial temperature range.

DC Electrical Characteristics

In this section, specifications may be designated as Advance, Preliminary, or Production. These terms are defined as follows:

Advance: Initial estimates are based on simulation, early characterization, and/or extrapolation from the characteristics of other families. Values are subject to change. Use as estimates, not for production.

Preliminary: Based on characterization. Further changes are not expected.

Production: These specifications are approved once the silicon has been characterized over numerous production lots. Parameter values are considered stable with no future changes expected.

All parameter limits are representative of worst-case supply voltage and junction temperature conditions. **Unless otherwise noted, the published parameter values apply to all Spartan®-3A devices. AC and DC characteristics are specified using the same numbers for both commercial and industrial grades.**

Absolute Maximum Ratings

Stresses beyond those listed under [Table 4](#): Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions is not implied. Exposure to absolute maximum conditions for extended periods of time adversely affects device reliability.

Table 4: Absolute Maximum Ratings

Notes:

- V_{CCINT} , V_{CCAUX} , and V_{CCO} supplies to the FPGA can be applied in any order. However, the FPGA's configuration source (Platform Flash, SPI Flash, parallel NOR Flash, microcontroller) might have specific requirements. Check the data sheet for the attached configuration source. Apply V_{CCINT} last for lowest overall power consumption (see [UG331](#) chapter "Powering Spartan-3 Generation FPGAs" for more information).
- To ensure successful power-on, V_{CCINT} , V_{CCO} Bank 2, and V_{CCAUX} supplies must rise through their respective threshold-voltage ranges with no dips at any point.

Notes:

1. This V_{CCO} range spans the lowest and highest operating voltages for all supported I/O standards. [Table 11](#) lists the recommended V_{CCO} range specific to each of the single-ended I/O standards, and [Table 13](#) lists that specific to the differential standards.
2. See [XAPP459](#), “Eliminating I/O Coupling Effects when Interfacing Large-Swing Single-Ended Signals to User I/O Pins.”
3. Measured between 10% and 90% V_{CCO} . Follow [Signal Integrity](#) recommendations.

General DC Characteristics for I/O Pins

Table 9: General DC Characteristics of User I/O, Dual-Purpose, and Dedicated Pins

| Symbol | Description | Test Conditions | | Min | Typ | Max | Units |
|-----------------|---|--|---|------------------------|------|-------|-----------|
| I_L | Leakage current at User I/O, Input-only, Dual-Purpose, and Dedicated pins, FPGA powered | Driver is in a high-impedance state, $V_{IN} = 0V$ or V_{CCO} max, sample-tested | | -10 | - | +10 | μA |
| I_{HS} | Leakage current on pins during hot socketing, FPGA unpowered | All pins except INIT_B, PROG_B, DONE, and JTAG pins when PUDC_B = 1. | | -10 | - | +10 | μA |
| | | INIT_B, PROG_B, DONE, and JTAG pins or other pins when PUDC_B = 0. | | Add $I_{HS} + I_{RPU}$ | | | μA |
| $I_{RPU}^{(2)}$ | Current through pull-up resistor at User I/O, Dual-Purpose, Input-only, and Dedicated pins. Dedicated pins are powered by V_{CCAUX} . | $V_{IN} = GND$ | V_{CCO} or $V_{CCAUX} = 3.0V$ to $3.6V$ | -151 | -315 | -710 | μA |
| | | | V_{CCO} or $V_{CCAUX} = 2.3V$ to $2.7V$ | -82 | -182 | -437 | μA |

| | | | $V_{IN} = 1.14V$ to $1.26V$ | 3.0 | 6.0 | 12.5 | $k\Omega$ |
| I_{REF} | V_{REF} current per pin | All V_{CCO} levels | | -10 | - | +10 | μA |
| C_{IN} | Input capacitance | - | | - | - | 10 | pF |
| R_{DT} | Resistance of optional differential termination circuit within a differential I/O pair. Not available on Input-only pairs. | $V_{CCO} = 3.3V \pm 10\%$ | LVDS_33, MINI_LVDS_33, RSDS_33 | 90 | 100 | 115 | Ω |
| | | $V_{CCO} = 2.5V \pm 10\%$ | LVDS_25, MINI_LVDS_25, RSDS_25 | 90 | 110 | - | Ω |

Notes:

1. The numbers in this table are based on the conditions set forth in Table 8.
2. This parameter is based on characterization. The pull-up resistance $R_{PU} = V_{CCO} / I_{RPU}$. The pull-down resistance $R_{PD} = V_{IN} / I_{RPD}$.

Quiescent Current Requirements

| | | XC3S700A | 6 | 28 | 34 | mA |
| | | XC3S1400A | 10 | 50 | 58 | mA |

Notes:

- The numbers in this table are based on the conditions set forth in [Table 8](#).
- Quiescent supply current is measured with all I/O drivers in a high-impedance state and with all pull-up/pull-down resistors at the I/O pads disabled. Typical values are characterized using typical devices at ambient room temperature (T_A of 25°C at V_{CCINT} = 1.2V, V_{CCO} = 3.3V, and V_{CCAUX} = 2.5V). The maximum limits are tested for each device at the respective maximum specified junction temperature and at maximum voltage limits with V_{CCINT} = 1.26V, V_{CCO} = 3.6V, and V_{CCAUX} = 3.6V. The FPGA is programmed with a "blank" configuration data file (that is, a design with no functional elements instantiated). For conditions other than those described above (for example, a design including functional elements), measured quiescent current levels will be different than the values in the table.
- There are two recommended ways to estimate the total power consumption (quiescent plus dynamic) for a specific design: a) The [Spartan-3A FPGA XPower Estimator](#) provides quick, approximate, typical estimates, and does not require a netlist of the design. b) XPower Analyzer uses a netlist as input to provide maximum estimates as well as more accurate typical estimates.
- The maximum numbers in this table indicate the minimum current each power rail requires in order for the FPGA to power-on successfully.
- For information on the power-saving Suspend mode, see [XAPP480: Using Suspend Mode in Spartan-3 Generation FPGAs](#). Suspend mode typically saves 40% total power consumption compared to quiescent current.

Notes:

- Descriptions of the symbols used in this table are as follows:
 V_{CCO} – the supply voltage for output drivers
 V_{REF} – the reference voltage for setting the input switching threshold
 V_{IL} – the input voltage that indicates a Low logic level
 V_{IH} – the input voltage that indicates a High logic level
- In general, the V_{CCO} rails supply only output drivers, not input circuits. The exceptions are for LVC MOS25 inputs when $V_{CCAUX} = 3.3V$ range and for PCI I/O standards.
- For device operation, the maximum signal voltage (V_{IH} max) can be as high as V_{IN} max. See Table 4.
- There is approximately 100 mV of hysteresis on inputs using LVC MOS33 and LVC MOS25 I/O standards.
- All Dedicated pins (PROG_B, DONE, SUSPEND, TCK, TDI, TDO, and TMS) draw power from the V_{CCAUX} rail and use the LVC MOS25 or LVC MOS33 standard depending on V_{CCAUX} . The Dual-Purpose configuration pins use the LVC MOS25 standard before the User mode. When using these pins as part of a standard 2.5V configuration interface, apply 2.5V to the V_{CCO} lines of Banks 0, 1, and 2 at power-on as well as throughout configuration.
- For information on PCI IP solutions, see www.xilinx.com/pci. The PCI IOSTANDARD is not supported on input-only pins. The PCIX IOSTANDARD is available and has equivalent characteristics but no PCI-X IP is supported.

Notes:

- The numbers in this table are based on the conditions set forth in [Table 8](#) and [Table 11](#).
- Descriptions of the symbols used in this table are as follows:
 I_{OL} — the output current condition under which V_{OL} is tested
 I_{OH} — the output current condition under which V_{OH} is tested
 V_{OL} — the output voltage that indicates a Low logic level
 V_{OH} — the output voltage that indicates a High logic level
 V_{IL} — the input voltage that indicates a Low logic level
 V_{IH} — the input voltage that indicates a High logic level
 V_{CCO} — the supply voltage for output drivers
 V_{REF} — the reference voltage for setting the input switching threshold
 V_{TT} — the voltage applied to a resistor termination
- For the LVCMOS and LVTTTL standards: the same V_{OL} and V_{OH} limits apply for both the Fast and Slow slew attributes.
- These higher-drive output standards are supported only on FPGA banks 1 and 3. Inputs are unrestricted. See the chapter "Using I/O Resources" in [UG331](#).
- Tested according to the relevant PCI specifications. For information on PCI IP solutions, see www.xilinx.com/pci. The PCIx IOSTANDARD is available and has equivalent characteristics but no PCI-X IP is supported.

Notes:

1. The V_{CCO} rails supply only differential output drivers, not input circuits.
2. V_{ICM} must be less than V_{CCAUX} .
3. These true differential output standards are supported only on FPGA banks 0 and 2. Inputs are unrestricted. See the chapter "Using I/O Resources" in [UG331](#).
4. See "External Termination Requirements for Differential I/O," page 20.
5. LVPECL is supported on inputs only, not outputs. Requires $V_{CCAUX}=3.3V \pm 10\%$.
6. LVPECL_33 maximum $V_{ICM} = V_{CCAUX} - (V_{ID} / 2)$
7. Requires $V_{CCAUX} = 3.3V \pm 10\%$ for inputs. $(V_{CCAUX} - 300\text{ mV}) \leq V_{ICM} \leq (V_{ICM} - 37\text{ mV})$
8. These higher-drive output standards are supported only on FPGA banks 1 and 3. Inputs are unrestricted. See the chapter "Using I/O Resources" in [UG331](#).
9. V_{REF} inputs are used for the DIFF_SSTL and DIFF_HSTL standards. The V_{REF} settings are the same as for the single-ended versions in [Table 11](#). Other differential standards do not use V_{REF} .

Notes:

1. The numbers in this table are based on the conditions set forth in Table 8 and Table 13.
2. See "External Termination Requirements for Differential I/O," page 20.
3. Output voltage measurements for all differential standards are made with a termination resistor (R_T) of 100Ω across the N and P pins of the differential signal pair.
4. At any given time, no more than two of the following differential output standards can be assigned to an I/O bank: LVDS_25, RSDS_25, MINI_LVDS_25, PPDS_25 when V_{CCO}=2.5V, or LVDS_33, RSDS_33, MINI_LVDS_33, TMDS_33, PPDS_33 when V_{CCO} = 3.3V

Switching Characteristics

All Spartan-3A FPGAs ship in two speed grades: –4 and the higher performance –5. Switching characteristics in this document are designated as Preview, Advance, Preliminary, or Production, as shown in [Table 16](#). Each category is defined as follows:

Preview: These specifications are based on estimates only and should not be used for timing analysis.

Advance: These specifications are based on simulations only and are typically available soon after establishing FPGA specifications. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

Preliminary: These specifications are based on complete early silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting preliminary delays is greatly reduced compared to Advance data.

Production: These specifications are approved once enough production silicon of a particular device family member has been characterized to provide full correlation between speed files and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

Software Version Requirements

Production-quality systems must use FPGA designs compiled using a speed file designated as PRODUCTION status. FPGA designs using a less mature speed file designation should only be used during system prototyping or pre-production qualification. FPGA designs with speed files designated as Preview, Advance, or Preliminary should not be used in a production-quality system.

Whenever a speed file designation changes, as a device matures toward Production status, rerun the latest Xilinx® ISE® software on the FPGA design to ensure that the FPGA design incorporates the latest timing information and software updates.

All parameter limits are representative of worst-case supply voltage and junction temperature conditions. **Unless otherwise noted, the published parameter values apply to all Spartan-3A devices. AC and DC characteristics are specified using the same numbers for both commercial and industrial grades.**

Timing parameters and their representative values are selected for inclusion below either because they are important as general design requirements or they indicate fundamental device performance characteristics. The Spartan-3A FPGA speed files (v1.39), part of the Xilinx Development Software, are the original source for many but not all of the values. The speed grade designations for these files are shown in [Table 16](#). For more complete, more precise, and worst-case data, use the values reported by the Xilinx static timing analyzer (TRACE in the Xilinx development software) and back-annotated to the simulation netlist.

| | | | XC3S700A | 4.97 | 5.34 | ns |
| | | | XC3S1400A | 5.06 | 5.69 | ns |

Notes:

1. The numbers in this table are tested using the methodology presented in [Table 27](#) and are based on the operating conditions set forth in [Table 8](#) and [Table 11](#).
2. This clock-to-output time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or a standard other than LVCMOS25 with 12 mA drive and Fast slew rate is assigned to the data Output. If the former is true, *add* the appropriate Input adjustment from [Table 23](#). If the latter is true, *add* the appropriate Output adjustment from [Table 26](#).
3. DCM output jitter is included in all measurements.

| | | | XC3S700A | -0.80 | -0.75 | ns |
| | | | XC3S1400A | -0.69 | -0.69 | ns |

Notes:

1. The numbers in this table are tested using the methodology presented in [Table 27](#) and are based on the operating conditions set forth in [Table 8](#) and [Table 11](#).
2. This setup time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or the data Input. If this is true of the Global Clock Input, subtract the appropriate adjustment from [Table 23](#). If this is true of the data Input, add the appropriate Input adjustment from the same table.
3. This hold time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or the data Input. If this is true of the Global Clock Input, add the appropriate Input adjustment from [Table 23](#). If this is true of the data Input, subtract the appropriate Input adjustment from the same table. When the hold time is negative, it is possible to change the data before the clock's active edge.
4. DCM output jitter is included in all measurements.

Notes:

1. The numbers in this table are tested using the methodology presented in [Table 27](#) and are based on the operating conditions set forth in [Table 8](#), [Table 11](#), and [Table 13](#).
2. These adjustments are used to convert output- and three-state-path times originally specified for the LVC MOS25 standard with 12 mA drive and Fast slew rate to times that correspond to other signal standards. Do not adjust times that measure when outputs go into a high-impedance state.

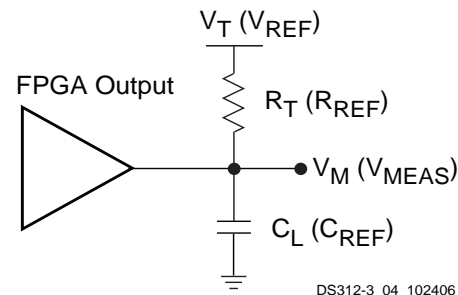

Timing Measurement Methodology

When measuring timing parameters at the programmable I/Os, different signal standards call for different test conditions. Table 27 lists the conditions to use for each standard.

The method for measuring Input timing is as follows: A signal that swings between a Low logic level of V_L and a High logic level of V_H is applied to the Input under test. Some standards also require the application of a bias voltage to the V_{REF} pins of a given bank to properly set the input-switching threshold. The measurement point of the Input signal (V_M) is commonly located halfway between V_L and V_H .

The Output test setup is shown in Figure 9. A termination voltage V_T is applied to the termination resistor R_T , the other end of which is connected to the Output. For each standard, R_T and V_T generally take on the standard values recommended for minimizing signal reflections. If the standard does not ordinarily use terminations (for example, LVCMOS, LVTTTL), then R_T is set to 1M Ω to indicate an

open connection, and V_T is set to zero. The same measurement point (V_M) that was used at the Input is also used at the Output.

Notes:

1. The names shown in parentheses are used in the IBIS file.

Notes:

- Descriptions of the relevant symbols are as follows:
 V_{REF} – The reference voltage for setting the input switching threshold
 V_{ICM} – The common mode input voltage
 V_M – Voltage of measurement point on signal transition
 V_L – Low-level test voltage at Input pin
 V_H – High-level test voltage at Input pin
 R_T – Effective termination resistance, which takes on a value of 1 M Ω when no parallel termination is required
 V_T – Termination voltage
- The load capacitance (C_L) at the Output pin is 0 pF for all signal standards.
- According to the PCI specification.

The capacitive load (C_L) is connected between the output and GND. *The Output timing for all standards, as published in the speed files and the data sheet, is always based on a C_L value of zero.* High-impedance probes (less than 1 pF) are used for all measurements. Any delay that the test fixture might contribute to test measurements is subtracted from those measurements to produce the final timing numbers as published in the speed files and data sheet.

Using IBIS Models to Simulate Load Conditions in Application

IBIS models permit the most accurate prediction of timing delays for a given application. The parameters found in the IBIS model (V_{REF} , R_{REF} , and V_{MEAS}) correspond directly with the parameters used in [Table 27](#) (V_T , R_T , and V_M). Do not confuse V_{REF} (the termination voltage) from the IBIS model with V_{REF} (the input-switching threshold) from the table. A fourth parameter, C_{REF} is always zero. The four parameters describe all relevant output test conditions. IBIS models are found in the Xilinx development software as well as at the following link:

www.xilinx.com/support/download/index.htm

Delays for a given application are simulated according to its specific load conditions as follows:

1. Simulate the desired signal standard with the output driver connected to the test setup shown in [Figure 9](#). Use parameter values V_T , R_T , and V_M from [Table 27](#). C_{REF} is zero.
2. Record the time to V_M .
3. Simulate the same signal standard with the output driver connected to the PCB trace with load. Use the appropriate IBIS model (including V_{REF} , R_{REF} , C_{REF} , and V_{MEAS} values) or capacitive value to represent the load.
4. Record the time to V_{MEAS} .
5. Compare the results of steps 2 and 4. Add (or subtract) the increase (or decrease) in delay to (or from) the appropriate Output standard adjustment ([Table 26](#)) to yield the worst-case delay of the PCB trace.

Simultaneously Switching Output Guidelines

This section provides guidelines for the recommended maximum allowable number of Simultaneous Switching Outputs (SSOs). These guidelines describe the maximum number of user I/O pins of a given output signal standard that should simultaneously switch in the same direction, while maintaining a safe level of switching noise. Meeting these guidelines for the stated test conditions ensures that the FPGA operates free from the adverse effects of ground and power bounce.

Ground or power bounce occurs when a large number of outputs simultaneously switch in the same direction. The output drive transistors all conduct current to a common voltage rail. Low-to-High transitions conduct to the V_{CCO} rail; High-to-Low transitions conduct to the GND rail. The resulting cumulative current transient induces a voltage difference across the inductance that exists between the die pad and the power supply or ground return. The inductance is associated with bonding wires, the package lead frame,

and any other signal routing inside the package. Other variables contribute to SSO noise levels, including stray inductance on the PCB as well as capacitive loading at receivers. Any SSO-induced voltage consequently affects internal switching noise margins and ultimately signal quality.

[Table 28](#) and [Table 29](#) provide the essential SSO guidelines. For each device/package combination, [Table 28](#) provides the number of equivalent V_{CCO}/GND pairs. The equivalent number of pairs is based on characterization and may not match the physical number of pairs. For each output signal standard and drive strength, [Table 29](#) recommends the maximum number of SSOs, switching in the same direction, allowed per V_{CCO}/GND pair within an I/O bank. The guidelines in [Table 29](#) are categorized by package style, slew rate, and output drive current. Furthermore, the number of SSOs is specified by I/O bank. Generally, the left and right I/O banks (Banks 1 and 3) support higher output drive current.

Multiply the appropriate numbers from [Table 28](#) and [Table 29](#) to calculate the maximum number of SSOs allowed within an I/O bank. Exceeding these SSO guidelines might result in increased power or ground bounce, degraded signal integrity, or increased system jitter.

$$SSO_{MAX}/IO \text{ Bank} = \text{Table 28} \times \text{Table 29}$$

The recommended maximum SSO values assume that the FPGA is soldered on the printed circuit board and that the board uses sound design practices. The SSO values do not apply for FPGAs mounted in sockets, due to the lead inductance introduced by the socket.

The SSO values assume that the V_{CCAUX} is powered at 3.3V. Setting V_{CCAUX} to 2.5V provides better SSO characteristics.

The number of SSOs allowed for quad-flat packages (VQ/TQ) is lower than for ball grid array packages (FG) due to the larger lead inductance of the quad-flat packages. Ball grid array packages are recommended for applications with a large number of simultaneously switching outputs.

Notes:

- Not all I/O standards are supported on all I/O banks. The left and right banks (I/O banks 1 and 3) support higher output drive current than the top and bottom banks (I/O banks 0 and 2). Similarly, true differential output standards, such as LVDS, RSDS, PPDS, miniLVDS, and TMDS, are only supported in top or bottom banks (I/O banks 0 and 2). Refer to [UG331: Spartan-3 Generation FPGA User Guide](#) for additional information.
- The numbers in this table are recommendations that assume sound board lay out practice. Test limits are the V_{IL}/V_{IH} voltage limits for the respective I/O standard.
- If more than one signal standard is assigned to the I/Os of a given bank, refer to [XAPP689: Managing Ground Bounce in Large FPGAs](#) for information on how to perform weighted average SSO calculations.

| F_{MULT} | Internal operating frequency for a two-stage 18x18 multiplier using the AREG and BREG input registers and the PREG output register ⁽¹⁾ | 0 | 280 | 0 | 250 | MHz |

Notes:

1. Combinational delay is less and pipelined performance is higher when multiplying input data with less than 18 bits.
2. The PREG register is typically used in both single-stage and two-stage pipelined multiplier implementations.
3. The PREG register is typically used when inferring a single-stage multiplier.
4. Input registers AREG or BREG are typically used when inferring a two-stage multiplier.
5. The numbers in this table are based on the operating conditions set forth in [Table 8](#).

Digital Clock Manager (DCM) Timing

For specification purposes, the DCM consists of three key components: the Delay-Locked Loop (DLL), the Digital Frequency Synthesizer (DFS), and the Phase Shifter (PS).

Aspects of DLL operation play a role in all DCM applications. All such applications inevitably use the CLKIN and the CLKFB inputs connected to either the CLK0 or the CLK2X feedback, respectively. Thus, specifications in the DLL tables (Table 36 and Table 37) apply to any application that only employs the DLL component. When the DFS and/or the PS components are used together with the DLL, then the specifications listed in the DFS and PS tables (Table 38 through Table 41) supersede any corresponding ones in the DLL tables. DLL specifications that do not

change with the addition of DFS or PS functions are presented in Table 36 and Table 37.

Period jitter and cycle-cycle jitter are two of many different ways of specifying clock jitter. Both specifications describe statistical variation from a mean value.

Period jitter is the worst-case deviation from the ideal clock period over a collection of millions of samples. In a histogram of period jitter, the mean value is the clock period.

Cycle-cycle jitter is the worst-case difference in clock period between adjacent clock cycles in the collection of clock periods sampled. In a histogram of cycle-cycle jitter, the mean value is zero.

| CLKIN_CYC_JITT_DLL_HF | | F _{CLKIN} > 150 MHz | - | ±150 | - | ±150 | ps |
| CLKIN_PER_JITT_DLL | Period jitter at the CLKIN input | | - | ±1 | - | ±1 | ns |
| CLKFB_DELAY_VAR_EXT | Allowable variation of off-chip feedback delay from the DCM output to the CLKFB input | | - | ±1 | - | ±1 | ns |

Notes:

1. DLL specifications apply when any of the DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV) are in use.
2. The DFS, when operating independently of the DLL, supports lower FCLKIN frequencies. See Table 38.
3. To support double the maximum effective FCLKIN limit, set the CLKIN_DIVIDE_BY_2 attribute to TRUE. This attribute divides the incoming clock period by two as it enters the DCM. The CLK2X output reproduces the clock frequency provided on the CLKIN input.
4. CLKIN input jitter beyond these limits might cause the DCM to lose lock.
5. The DCM specifications are guaranteed when both adjacent DCMs are locked.

| Delay Lines | | | | | | | | |
| DCM_DELAY_STEP ⁽⁵⁾ | Finest delay resolution, averaged over all steps | All | 15 | 35 | 15 | 35 | ps | |

Notes:

- The numbers in this table are based on the operating conditions set forth in Table 8 and Table 36.
- Indicates the maximum amount of output jitter that the DCM adds to the jitter on the CLKIN input.
- For optimal jitter tolerance and faster lock time, use the CLKIN_PERIOD attribute.
- Some jitter and duty-cycle specifications include 1% of input clock period or 0.01 UI. For example, the data sheet specifies a maximum jitter of "±[1% of CLKIN period + 150]". Assume the CLKIN frequency is 100 MHz. The equivalent CLKIN period is 10 ns and 1% of 10 ns is 0.1 ns or 100 ps. According to the data sheet, the maximum jitter is ±[100 ps + 150 ps] = ±250ps.
- The typical delay step size is 23 ps.
- Improved to 375 MHz via SCD 4103 for selected part/package combinations. Contact Xilinx for details.

| CLKIN_PER_JITT_FX | Period jitter at the CLKIN input | | – | ±1 | – | ±1 | ns |

Notes:

- DFS specifications apply when either of the DFS outputs (CLKFX or CLKFX180) are used.
- If both DFS and DLL outputs are used on the same DCM, follow the more restrictive CLKIN_FREQ_DLL specifications in [Table 36](#).
- CLKIN input jitter beyond these limits may cause the DCM to lose lock.
- Improved to 375 MHz via SCD 4103 for selected part/package combinations. Contact Xilinx for details.

| LOCK_FX ^(2, 3) | The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. The DFS asserts LOCKED when the CLKFX and CLKFX180 signals are valid. If using both the DLL and the DFS, use the longer locking time. | All | $5 \text{ MHz} \leq F_{\text{CLKIN}} \leq 15 \text{ MHz}$ | – | 5 | – | 5 | ms |
| | | | $F_{\text{CLKIN}} > 15 \text{ MHz}$ | – | 450 | – | 450 | μs |

Notes:

1. The numbers in this table are based on the operating conditions set forth in [Table 8](#) and [Table 38](#).
2. DFS performance requires the additional logic automatically added by ISE 9.1i and later software revisions.
3. For optimal jitter tolerance and faster lock time, use the CLKIN_PERIOD attribute.
4. Maximum output jitter is characterized within a reasonable noise environment (40 SSOs and 25% CLB switching) on an XC3S1400A FPGA. Output jitter strongly depends on the environment, including the number of SSOs, the output drive strength, CLB utilization, CLB switching activities, switching frequency, power supply and PCB design. The actual maximum output jitter depends on the system application.
5. The CLKFX and CLKFX180 outputs always have an approximate 50% duty cycle.
6. Some duty-cycle and alignment specifications include a percentage of the CLKFX output period. For example, the data sheet specifies a maximum CLKFX jitter of “±[1% of CLKFX period + 200]”. Assume the CLKFX output frequency is 100 MHz. The equivalent CLKFX period is 10 ns and 1% of 10 ns is 0.1 ns or 100 ps. According to the data sheet, the maximum jitter is ±[100 ps + 200 ps] = ±300 ps.
7. Improved to 375 MHz via SCD 4103 for selected part/package combinations. Contact Xilinx for details.

| | | N/A | N/A | minutes |

Notes:

1. This limit only applies to applications that use the DCM DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV). The DCM DFS outputs (CLKFX, CLKFX180) are unaffected.
2. This specification is equivalent to the Virtex™-4 DCM_RESET specification. This specification does not apply for Spartan-3A FPGAs.
3. This specification is equivalent to the Virtex-4 TCONFIG specification. This specification does not apply for Spartan-3A FPGAs.

DNA Port Timing

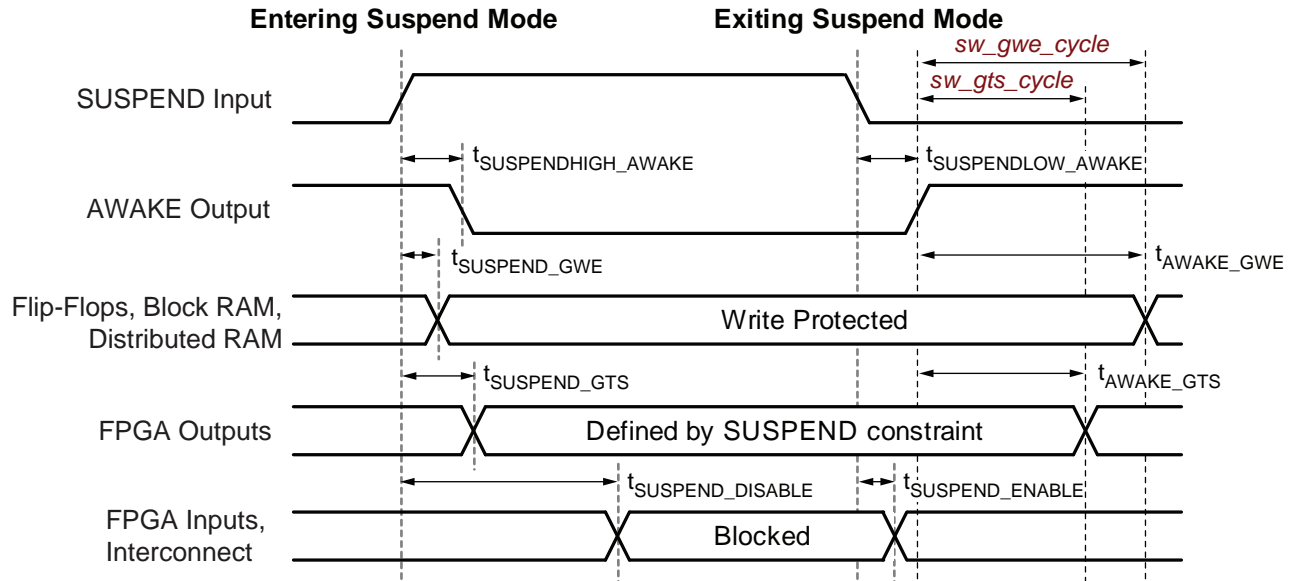

Table 43: DNA_PORT Interface Timing

| Symbol | Description | Min | Max | Units |
|----------------------|--|-----|--------|-------|
| T _{DNASSU} | Setup time on SHIFT before the rising edge of CLK | 1.0 | – | ns |
| T _{DNASH} | Hold time on SHIFT after the rising edge of CLK | 0.5 | – | ns |
| T _{DNADSU} | Setup time on DIN before the rising edge of CLK | 1.0 | – | ns |
| T _{DNADH} | Hold time on DIN after the rising edge of CLK | 0.5 | – | ns |
| T _{DNARSU} | Setup time on READ before the rising edge of CLK | 5.0 | 10,000 | ns |
| T _{DNARH} | Hold time on READ after the rising edge of CLK | 0 | – | ns |
| T _{DNADCKO} | Clock-to-output delay on DOUT after rising edge of CLK | 0.5 | 1.5 | ns |
| T _{DNACLKF} | CLK frequency | 0 | 100 | MHz |
| T _{DNACLKL} | CLK High time | 1.0 | ∞ | ns |
| T _{DNACLKH} | CLK Low time | 1.0 | ∞ | ns |

Notes:

1. The minimum READ pulse width is 5 ns, the maximum READ pulse width is 10 μs.
2. The numbers in this table are based on the operating conditions set forth in Table 8.

Suspend Mode Timing

Figure 10: Suspend Mode Timing

Table 44: Suspend Mode Timing Parameters

| Symbol | Description | Min | Typ | Max | Units |
|---------------------------------|--|------|------------|------|-------|
| Entering Suspend Mode | | | | | |
| $T_{\text{SUSPENDHIGH_AWAKE}}$ | Rising edge of SUSPEND pin to falling edge of AWAKE pin without glitch filter (<i>suspend_filter:No</i>) | – | 7 | – | ns |
| $T_{\text{SUSPENDFILTER}}$ | Adjustment to SUSPEND pin rising edge parameters when glitch filter enabled (<i>suspend_filter:Yes</i>) | +160 | +300 | +600 | ns |
| $T_{\text{SUSPEND_GWE}}$ | Rising edge of SUSPEND pin until FPGA output pins drive their defined SUSPEND constraint behavior | – | 10 | – | ns |
| $T_{\text{SUSPEND_GTS}}$ | Rising edge of SUSPEND pin to write-protect lock on all writable clocked elements | – | <5 | – | ns |
| $T_{\text{SUSPEND_DISABLE}}$ | Rising edge of the SUSPEND pin to FPGA input pins and interconnect disabled | – | 340 | – | ns |
| Exiting Suspend Mode | | | | | |
| $T_{\text{SUSPENDLOW_AWAKE}}$ | Falling edge of the SUSPEND pin to rising edge of the AWAKE pin. Does not include DCM lock time. | – | 4 to 108 | – | μs |
| $T_{\text{SUSPEND_ENABLE}}$ | Falling edge of the SUSPEND pin to FPGA input pins and interconnect re-enabled | – | 3.7 to 109 | – | μs |
| $T_{\text{AWAKE_GWE1}}$ | Rising edge of the AWAKE pin until write-protect lock released on all writable clocked elements, using <i>sw_clk:InternalClock</i> and <i>sw_gwe_cycle:1</i> . | – | 67 | – | ns |
| $T_{\text{AWAKE_GWE512}}$ | Rising edge of the AWAKE pin until write-protect lock released on all writable clocked elements, using <i>sw_clk:InternalClock</i> and <i>sw_gwe_cycle:512</i> . | – | 14 | – | μs |
| $T_{\text{AWAKE_GTS1}}$ | Rising edge of the AWAKE pin until outputs return to the behavior described in the FPGA application, using <i>sw_clk:InternalClock</i> and <i>sw_gts_cycle:1</i> . | – | 57 | – | ns |
| $T_{\text{AWAKE_GTS512}}$ | Rising edge of the AWAKE pin until outputs return to the behavior described in the FPGA application, using <i>sw_clk:InternalClock</i> and <i>sw_gts_cycle:512</i> . | – | 14 | – | μs |

Notes:

1. These parameters based on characterization.
2. For information on using the Spartan-3A Suspend feature, see [XAPP480: Using Suspend Mode in Spartan-3 Generation FPGAs](#).

Configuration and JTAG Timing

General Configuration Power-On/Reconfigure Timing

Notes:

1. The V_{CCINT} , V_{CCAUX} , and V_{CCO} supplies can be applied in any order.
2. The Low-going pulse on $PROG_B$ is optional after power-on but necessary for reconfiguration without a power cycle.
3. The rising edge of $INIT_B$ samples the voltage levels applied to the mode pins (M0 - M2).

Figure 11: Waveforms for Power-On and the Beginning of Configuration

Table 45: Power-On Timing and the Beginning of Configuration

| Symbol | Description | Device | All Speed Grades | | Units |
|------------------|--|-----------|------------------|-----|---------|
| | | | Min | Max | |
| $T_{POR}^{(2)}$ | The time from the application of V_{CCINT} , V_{CCAUX} , and V_{CCO} Bank 2 supply voltage ramps (whichever occurs last) to the rising transition of the $INIT_B$ pin | All | – | 18 | ms |
| T_{PROG} | The width of the low-going pulse on the $PROG_B$ pin | All | 0.5 | – | μ s |
| $T_{PL}^{(2)}$ | The time from the rising edge of the $PROG_B$ pin to the rising transition on the $INIT_B$ pin | XC3S50A | – | 0.5 | ms |
| | | XC3S200A | – | 0.5 | ms |
| | | XC3S400A | – | 1 | ms |
| | | XC3S700A | – | 2 | ms |
| | | XC3S1400A | – | 2 | ms |
| T_{INIT} | Minimum Low pulse width on $INIT_B$ output | All | 250 | – | ns |
| $T_{ICCK}^{(3)}$ | The time from the rising edge of the $INIT_B$ pin to the generation of the configuration clock signal at the $CCLK$ output pin | All | 0.5 | 4 | μ s |

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 8. This means power must be applied to all V_{CCINT} , V_{CCO} , and V_{CCAUX} lines.
2. Power-on reset and the clearing of configuration memory occurs during this period.
3. This specification applies only to the Master Serial, SPI, and BPI modes.
4. For details on configuration, see [UG332 Spartan-3 Generation Configuration User Guide](#).

Table 50: Timing for the Master Serial and Slave Serial Configuration Modes

| Symbol | Description | Slave/ Master | All Speed Grades | | Units | |
|------------------------------|--|------------------|----------------------------|-----|-------|-----|
| | | | Min | Max | | |
| Clock-to-Output Times | | | | | | |
| T_{CCO} | The time from the falling transition on the CCLK pin to data appearing at the DOUT pin | Both | 1.5 | 10 | ns | |
| Setup Times | | | | | | |
| T_{DCC} | The time from the setup of data at the DIN pin to the rising transition at the CCLK pin | Both | 7 | – | ns | |
| Hold Times | | | | | | |
| T_{CCD} | The time from the rising transition at the CCLK pin to the point when data is last held at the DIN pin | Master | 0 | – | ns | |
| | | Slave | 1.0 | | | |
| Clock Timing | | | | | | |
| T_{CCH} | High pulse width at the CCLK input pin | Master | See Table 48 | | | |
| | | Slave | See Table 49 | | | |
| T_{CCL} | Low pulse width at the CCLK input pin | Master | See Table 48 | | | |
| | | Slave | See Table 49 | | | |
| F_{CCSER} | Frequency of the clock signal at the CCLK input pin | Slave | No bitstream compression | 0 | 100 | MHz |
| | | | With bitstream compression | 0 | 100 | MHz |

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 8.
2. For serial configuration with a daisy-chain of multiple FPGAs, the maximum limit is 25 MHz.

Slave Parallel Mode Timing

DS529-3_02_051607

Notes:

1. It is possible to abort configuration by pulling CSI_B Low in a given CCLK cycle, then switching RDWR_B Low or High in any subsequent cycle for which CSI_B remains Low. The RDWR_B pin asynchronously controls the driver impedance of the D0 - D7 bus. When RDWR_B switches High, be careful to avoid contention on the D0 - D7 bus.
2. To pause configuration, pause CCLK instead of de-asserting CSI_B. See [UG332](#) Chapter 7 section "Non-Continuous SelectMAP Data Loading" for more details.

Figure 13: Waveforms for Slave Parallel Configuration

| Symbol | Description | All Speed Grades | | Units | |
|---------------------|--|----------------------------|-----|-------|-----|
| | | Min | Max | | |
| Setup Times | | | | | |
| $T_{SMDCC}^{(2)}$ | The time from the setup of data at the D0-D7 pins to the rising transition at the CCLK pin | 7 | – | ns | |
| T_{SMCCS} | Setup time on the CSI_B pin before the rising transition at the CCLK pin | 7 | – | ns | |
| T_{SMCCW} | Setup time on the RDWR_B pin before the rising transition at the CCLK pin | 15 | – | ns | |
| Hold Times | | | | | |
| T_{SMCCD} | The time from the rising transition at the CCLK pin to the point when data is last held at the D0-D7 pins | 1.0 | – | ns | |
| T_{SMCCS} | The time from the rising transition at the CCLK pin to the point when a logic level is last held at the CSO_B pin | 0 | – | ns | |
| T_{SMWCC} | The time from the rising transition at the CCLK pin to the point when a logic level is last held at the RDWR_B pin | 0 | – | ns | |
| Clock Timing | | | | | |
| T_{CCH} | The High pulse width at the CCLK input pin | 5 | – | ns | |
| T_{CCL} | The Low pulse width at the CCLK input pin | 5 | – | ns | |
| F_{CCPAR} | Frequency of the clock signal at the CCLK input pin | No bitstream compression | 0 | 80 | MHz |
| | | With bitstream compression | 0 | 80 | MHz |

Notes:

1. The numbers in this table are based on the operating conditions set forth in [Table 8](#).
2. Some Xilinx documents refer to Parallel modes as "SelectMAP" modes.

Serial Peripheral Interface (SPI) Configuration Timing

Shaded values indicate specifications on attached SPI Flash PROM.

DS529-3_06_102506

Figure 14: Waveforms for Serial Peripheral Interface (SPI) Configuration

Table 52: Timing for Serial Peripheral Interface (SPI) Configuration Mode

| Symbol | Description | Minimum | Maximum | Units |
|-------------|---|---------|--------------|-------|
| T_{CCLK1} | Initial CCLK clock period | | See Table 46 | |
| T_{CCLKn} | CCLK clock period after FPGA loads ConfigRate bitstream option setting | | See Table 46 | |
| T_{MINIT} | Setup time on VS[2:0] variant-select pins and M[2:0] mode pins before the rising edge of INIT_B | 50 | – | ns |
| T_{INITM} | Hold time on VS[2:0] variant-select pins and M[2:0] mode pins after the rising edge of INIT_B | 0 | – | ns |
| T_{CCO} | MOSI output valid delay after CCLK falling clock edge | | See Table 50 | |
| T_{DCC} | Setup time on the DIN data input before CCLK rising clock edge | | See Table 50 | |
| T_{CCD} | Hold time on the DIN data input after CCLK rising clock edge | | See Table 50 | |

Table 53: Configuration Timing Requirements for Attached SPI Serial Flash

| Symbol | Description | Requirement | Units |
|----------------|--|-------------------------------------|-------|
| T_{CCS} | SPI serial Flash PROM chip-select time | $T_{CCS} \leq T_{MCCL1} - T_{CC0}$ | ns |
| T_{DSU} | SPI serial Flash PROM data input setup time | $T_{DSU} \leq T_{MCCL1} - T_{CC0}$ | ns |
| T_{DH} | SPI serial Flash PROM data input hold time | $T_{DH} \leq T_{MCCH1}$ | ns |
| T_V | SPI serial Flash PROM data clock-to-output time | $T_V \leq T_{MCCLn} - T_{DCC}$ | ns |
| f_C or f_R | Maximum SPI serial Flash PROM clock frequency (also depends on specific read command used) | $f_C \geq \frac{1}{T_{CCLKn(min)}}$ | MHz |

Notes:

1. These requirements are for successful FPGA configuration in SPI mode, where the FPGA generates the CCLK signal. The post-configuration timing can be different to support the specific needs of the application loaded into the FPGA.
2. Subtract additional printed circuit board routing delay as required by the application.

Byte Peripheral Interface (BPI) Configuration Timing

Figure 15: Waveforms for Byte-wide Peripheral Interface (BPI) Configuration

Table 54: Timing for Byte-wide Peripheral Interface (BPI) Configuration Mode

| Symbol | Description | Minimum | Maximum | Units |
|-----------------------|--|-----------------------|---------|---------------------------|
| T _{CCLK1} | Initial CCLK clock period | See Table 46 | | |
| T _{CCLKn} | CCLK clock period after FPGA loads ConfigRate setting | See Table 46 | | |
| T _{MINIT} | Setup time on M[2:0] mode pins before the rising edge of INIT_B | 50 | – | ns |
| T _{INITM} | Hold time on M[2:0] mode pins after the rising edge of INIT_B | 0 | – | ns |
| T _{INITADDR} | Minimum period of initial A[25:0] address cycle; LDC[2:0] and HDC are asserted and valid | 5 | 5 | T _{CCLK1} cycles |
| T _{CCO} | Address A[25:0] outputs valid after CCLK falling edge | See Table 50 | | |
| T _{DCC} | Setup time on D[7:0] data inputs before CCLK rising edge | See TSMDC in Table 51 | | |
| T _{CCD} | Hold time on D[7:0] data inputs after CCLK rising edge | 0 | – | ns |

Table 55: Configuration Timing Requirements for Attached Parallel NOR Flash

| Symbol | Description | Requirement | Units |
|--|--|---|-------|
| T_{CE} (t_{ELQV}) | Parallel NOR Flash PROM chip-select time | $T_{CE} \leq T_{INITADDR}$ | ns |
| T_{OE} (t_{GLQV}) | Parallel NOR Flash PROM output-enable time | $T_{OE} \leq T_{INITADDR}$ | ns |
| T_{ACC} (t_{AVQV}) | Parallel NOR Flash PROM read access time | $T_{ACC} \leq T_{CCLKn(min)} - T_{CCO} - T_{DCC} - PCE$ | ns |
| T_{BYTE} (t_{FLQV}, t_{FHQV}) | For x8/x16 PROMs only: BYTE# to output valid time ⁽³⁾ | $T_{BYTE} \leq T_{INITADDR}$ | ns |

Notes:

1. These requirements are for successful FPGA configuration in BPI mode, where the FPGA generates the CCLK signal. The post-configuration timing can be different to support the specific needs of the application loaded into the FPGA.
2. Subtract additional printed circuit board routing delay as required by the application.
3. The initial BYTE# timing can be extended using an external, appropriately sized pull-down resistor on the FPGA's LDC2 pin. The resistor value also depends on whether the FPGA's PUDC_B pin is High or Low.

| T _{CCL} | The Low pulse width at the TCK pin | | 5 | – | ns |
| T _{CCHDNA} | The High pulse width at the TCK pin | During ISC_DNA command | 10 | 10,000 | ns |
| T _{CCLDNA} | The Low pulse width at the TCK pin | | 10 | 10,000 | ns |
| F _{TCK} | Frequency of the TCK signal | All operations on XC3S50A, XC3S200A, and XC3S400A FPGAs and for BYPASS or HIGHZ instructions on all FPGAs | 0 | 33 | MHz |
| | | All operations on XC3S700A and XC3S1400A FPGAs, except for BYPASS or HIGHZ instructions | | 20 | |

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 8.
2. For details on JTAG see Chapter 9 “JTAG Configuration Mode and Boundary-Scan” in [UG332 Spartan-3 Generation Configuration User Guide](#).

Revision History

The following table shows the revision history for this document.

| Date | Version | Revision |
|----------|---------|--|
| 12/05/06 | 1.0 | Initial release. |
| 02/02/07 | 1.1 | Promoted to Preliminary status. Moved Table 15 to under "DC Electrical Characteristics" section. Updated all timing specifications for the v1.32 speed files. Added recommended Simultaneous Switching Output (SSO) limits in Table 29 . Set a 10 μ s maximum pulse width for the DNA_PORT READ signal and the JTAG clock input during the ISC_DNA command, affecting both Table 43 and Table 56 . Described "External Termination Requirements for Differential I/O." Added separate DIN hold time for Slave mode in Table 50 . Corrected wording in Table 52 and Table 54 ; no specifications affected. |
| 03/16/07 | 1.2 | Updated all AC timing specifications to the v1.34 speeds file. Promoted the XC3S700A and XC3S1400A FPGAs offered in the -4 speed grade to Production status, as shown in Table 16 . Added Note 2 to Table 39 regarding the extra logic (one LUT) automatically added by ISE 9.1i and later software revisions for any DCM application that leverages the Digital Frequency Synthesizer (DFS). Separated some JTAG specifications by array size or function, as shown in Table 56 . Updated quiescent current limits in Table 10 . |
| 04/23/07 | 1.3 | Updated all AC timing specifications to the v1.35 speeds file. Promoted all family members except the XC3S400A to Production status, as shown in Table 16 . |
| 05/08/07 | 1.4 | Updated XC3S400A to Production and v1.36 speeds file. Added banking rules and other explanatory footnotes to Table 12 and Table 13 . Corrected DIFF_SSTL3_II V _{OL} Max in Table 14 . Improved XC3S400A Pin-to-Pin Clock-to-Output times in Table 18 . Updated XC3S400A Pin-to-Pin Setup Times in Table 19 . Updated TIOICKPD for -5 in Table 20 . Added SSO numbers to Table 28 and Table 29 . Removed invalid Embedded Multiplier Hold Times in Table 34 . Improved CLKOUT_FREQ_CLK90 in Table 37 . Improved T _{TDITCK} and F _{TCK} performance for XC3S400A in Table 56 . |
| 07/10/07 | 1.5 | Added DIFF_HSTL_I and DIFF_HSTL_III to Table 13 , Table 14 , Table 27 , and Table 29 . Updated TMD5 DC characteristics in Table 14 . Updated for speed file v1.37 in ISE 9.2.01i as shown in Table 17 . Updated pin-to-pin setup and hold times in Table 19 . Updated TMD5 output adjustment in Table 26 . Updated I/O Test Method values in Table 27 . Added BLVDS SSO numbers in Table 29 . For Multiplier block, updated setup times and added hold times to Table 34 . Updated block RAM clock width in Table 35 . Updated CLKOUT_PER_JITT_2X and CLKOUT_PER_JITT_DV2 in Table 37 . Added CCLK specifications for Commercial in Table 46 through Table 48 . |
| 04/15/08 | 1.6 | Added V _{IN} to Recommended Operating Conditions in Table 8 and added reference to XAPP459 , "Eliminating I/O Coupling Effects when Interfacing Large-Swing Single-Ended Signals to User I/O Pins." Reduced typical I _{CCINTO} and I _{CCAUXQ} quiescent current values by 12%-58% in Table 10 . Increased V _{IL} max to 0.4V for LVCMOS12/15/18 and improved V _{IH} min to 0.7V for LVCMOS12 in Table 11 . Changed V _{OL} max to 0.4V and V _{OH} min to V _{CCO} -0.4V for LVCMOS15/18 in Table 12 . Noted latest speed file v1.39 in ISE 10.1 software in Table 16 . Added new packages to SSO limits in Table 28 and Table 29 . Improved SSTL18_II SSO limit for FG packages in Table 29 . Improved F _{BUFG} for -4 to 334 MHz in Table 33 . Added references to 375 MHz performance via SCD 4103 in Table 33 , Table 38 , Table 39 , and Table 40 . Restored Units column to Table 44 . Updated CCLK output maximum period in Table 46 to match minimum frequency in Table 47 . Corrected BPI active clock edge in Figure 15 and Table 54 . |

Introduction

This section describes how the various pins on a Spartan®-3A FPGA connect within the supported component packages, and provides device-specific thermal characteristics. For general information on the pin functions and the package characteristics, see the Packaging section of UG331: *Spartan-3 Generation FPGA User Guide*.

- UG331: Spartan-3 Generation FPGA User Guide**
www.xilinx.com/support/documentation/user_guides/ug331.pdf

Spartan-3A FPGAs are available in both standard and Pb-free, RoHS versions of each package, with the Pb-free version adding a “G” to the middle of the package code.

Table 57: Types of Pins on Spartan-3A FPGAs

| Type / Color Code | Description | Pin Name(s) in Type |
|-------------------|---|--|
| I/O | Unrestricted, general-purpose user-I/O pin. Most pins can be paired together to form differential I/Os. | IO_# IO_Lxxy_# |
| INPUT | Unrestricted, general-purpose input-only pin. This pin does not have an output structure or PCI clamp diode. | IP_# IP_Lxxy_# |
| DUAL | Dual-purpose pin used in some configuration modes during the configuration process and then usually available as a user I/O after configuration. If the pin is not used during configuration, this pin behaves as an I/O-type pin. See UG332: Spartan-3 Generation Configuration User Guide for additional information on these signals. | M[2:0] PUDC_B CCLK MOSI/CSI_B D[7:1] D0/DIN DOUT CSO_B RDWR_B INIT_B A[25:0] VS[2:0] LDC[2:0] HDC |
| VREF | Dual-purpose pin that is either a user-I/O pin or Input-only pin, or, along with all other VREF pins in the same bank, provides a reference voltage input for certain I/O standards. If used for a reference voltage within a bank, all VREF pins within the bank must be connected. | IP/VREF_# IP_Lxxy_#/VREF_# IO/VREF_# IO_Lxxy_#/VREF_# |
| CLK | Either a user-I/O pin or an input to a specific clock buffer driver. Most packages have 16 global clock inputs that optionally clock the entire device. The exceptions are the TQ144 and the XC3S50A in the FT256 package). The RHCLK inputs optionally clock the right half of the device. The LHCLK inputs optionally clock the left half of the device. See the Using Global Clock Resources chapter in UG331: Spartan-3 Generation FPGA User Guide for additional information on these signals. | IO_Lxxy_#/GCLK[15:0], IO_Lxxy_#/LHCLK[7:0], IO_Lxxy_#/RHCLK[7:0] |
| CONFIG | Dedicated configuration pin, two per device. Not available as a user-I/O pin. Every package has two dedicated configuration pins. These pins are powered by VCCAUX. See the UG332: Spartan-3 Generation Configuration User Guide for additional information on the DONE and PROG_B signals. | DONE, PROG_B |

Except for the thermal characteristics, all information for the standard package applies equally to the Pb-free package.

Pin Types

Most pins on a Spartan-3A FPGA are general-purpose, user-defined I/O pins. There are, however, up to 12 different functional types of pins on Spartan-3A FPGA packages, as outlined in [Table 57](#). In the package footprint drawings that follow, the individual pins are color-coded according to pin type as in the table.

Table 57: Types of Pins on Spartan-3A FPGAs (Continued)

| Type / Color Code | Description | Pin Name(s) in Type |
|-------------------|--|---------------------|
| PWR MGMT | Control and status pins for the power-saving Suspend mode. SUSPEND is a dedicated pin. AWAKE is a Dual-Purpose pin. Unless Suspend mode is enabled in the application, AWAKE is available as a user-I/O pin. | SUSPEND, AWAKE |
| JTAG | Dedicated JTAG pin - 4 per device. Not available as a user-I/O pin. Every package has four dedicated JTAG pins. These pins are powered by VCCAUX. | TDI, TMS, TCK, TDO |
| GND | Dedicated ground pin. The number of GND pins depends on the package used. All must be connected. | GND |
| VCCAUX | Dedicated auxiliary power supply pin. The number of VCCAUX pins depends on the package used. All must be connected. | VCCAUX |
| VCCINT | Dedicated internal core logic power supply pin. The number of VCCINT pins depends on the package used. All must be connected to +1.2V. | VCCINT |
| VCCO | Along with all the other VCCO pins in the same bank, this pin supplies power to the output buffers within the I/O bank and sets the input threshold voltage for some I/O standards. All must be connected. | VCCO_# |
| N.C. | This package pin is not connected in this specific device/package combination but may be connected in larger devices in the same package. | N.C. |

Notes:

1. # = I/O bank number, an integer between 0 and 3.

Package Pins by Type

Each package has three separate voltage supply inputs—VCCINT, VCCAUX, and VCCO—and a common ground return, GND. The numbers of pins dedicated to these functions vary by package, as shown in [Table 58](#).

Table 58: Power and Ground Supply Pins by Package

| Package | VCCINT | VCCAUX | VCCO | GND |
|-----------------------|--------|--------|------|-----|
| VQ100 | 4 | 3 | 6 | 13 |
| TQ144 | 4 | 4 | 8 | 13 |
| FT256 (50A/200A/400A) | 6 | 4 | 16 | 28 |
| FT256 (700A/1400A) | 15 | 10 | 13 | 50 |
| FG320 | 6 | 8 | 16 | 32 |
| FG400 | 9 | 8 | 22 | 43 |
| FG484 | 15 | 10 | 24 | 53 |
| FG676 | 23 | 14 | 36 | 77 |

A majority of package pins are user-defined I/O or input pins. However, the numbers and characteristics of these I/O depend on the device type and the package in which it is available, as shown in [Table 59](#). The table shows the maximum number of single-ended I/O pins available, assuming that all I/O-, INPUT-, DUAL-, VREF-, and CLK-type pins are used as general-purpose I/O. AWAKE is counted here as a Dual-Purpose I/O pin. Likewise, the table shows the maximum number of differential pin-pairs available on the package. Finally, the table shows how the total maximum user-I/Os are distributed by pin type, including the number of unconnected—N.C.—pins on the device.

Not all I/O standards are supported on all I/O banks. The left and right banks (I/O banks 1 and 3) support higher output drive current than the top and bottom banks (I/O banks 0 and 2). Similarly, true differential output standards, such as LVDS, RSFS, PPDS, miniLVDS, and TMDS, are only supported in the top or bottom banks (I/O banks 0 and 2). Inputs are unrestricted. For more details, see the chapter “Using I/O Resources” in [UG331](#).

Notes:

1. Some VREFs are on INPUT pins. See pinout tables for details.

Electronic versions of the package pinout tables and footprints are available for download from the Xilinx website. Using a spreadsheet program, the data can be sorted and reformatted according to any specific needs. Similarly, the ASCII-text file is easily parsed by most scripting programs.

Notes:

1. Package mass is $\pm 10\%$.

Each package style is available in an environmentally friendly lead-free (Pb-free) option. The Pb-free packages include an extra 'G' in the package style name. For example, the standard "CS484" package becomes "CSG484" when ordered as the Pb-free option. Leaded (non-Pb-free) packages may be available for selected devices, with the same pin-out and without the "G" in the ordering code; contact Xilinx sales for more information. The mechanical dimensions of the standard and Pb-free packages are similar, as shown in the mechanical drawings provided in Table 61.

For additional package information, see [UG112: Device Package User Guide](#).

Mechanical Drawings

Detailed mechanical drawings for each package type are available from the Xilinx web site at the specified location in Table 61.

Material Declaration Data Sheets (MDDS) are also available on the [Xilinx web site](#) for each package.

Package Thermal Characteristics

The power dissipated by an FPGA application has implications on package selection and system design. The power consumed by a Spartan-3A FPGA is reported using either the [XPower Power Estimator](#) or the [XPower Analyzer](#) calculator integrated in the Xilinx® ISE® development software. [Table 62](#) provides the thermal characteristics for the various Spartan-3A FPGA package offerings. This information is also available using the Thermal Query tool on [www.xilinx.com](http://www.xilinx.com/cgi-bin/thermal/thermal.pl) (www.xilinx.com/cgi-bin/thermal/thermal.pl).

The junction-to-case thermal resistance (θ_{JC}) indicates the difference between the temperature measured on the package body (case) and the die junction temperature per watt of power consumption. The junction-to-board (θ_{JB}) value similarly reports the difference between the board and junction temperature. The junction-to-ambient (θ_{JA}) value reports the temperature difference between the ambient environment and the junction temperature. The θ_{JA} value is reported at different air velocities, measured in linear feet per minute (LFM). The “Still Air (0 LFM)” column shows the θ_{JA} value in a system without a fan. The thermal resistance drops with increasing air flow.

Table 62: Spartan-3A Package Thermal Characteristics

| Package | Device | Junction-to-Case (θ_{JC}) | Junction-to-Board (θ_{JB}) | Junction-to-Ambient (θ_{JA}) at Different Air Flows | | | | Units |

VQ100: 100-lead Very Thin Quad Flat Package

The XC3S50A and XC3S200 are available in the 100-lead very thin quad flat package, VQ100.

[Table 63](#) lists all the package pins. They are sorted by bank number and then by pin name. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The VQ100 does not support Suspend mode (Suspend and Awake are not connected), the address output pins for the Byte-wide Peripheral Interface (BPI) configuration mode, or daisy chain configuration (DOUT is not connected).

[Table 63](#) also indicates that some differential I/O pairs have different assignments between the XC3S50A and the XC3S200A, highlighted in light blue. See "[Footprint Migration Differences](#)," [page 70](#) for additional information.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at

www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip.

User I/Os by Bank

Table 64 indicates how the 68 available user-I/O pins are distributed between the four I/O banks on the VQ100 package.

Footprint Migration Differences

The XC3S50A and XC3S200 have common VQ100 pinouts except for some differences in alignment of differential I/O pairs.

Differential I/O Alignment Differences

Some differential I/O pairs in the VQ100 on the XC3S50A FPGA are aligned differently than the corresponding pairs on the XC3S200A FPGAs, as shown in Table 65. All the mismatched pairs are in I/O Bank 2. These differences are indicated with the black diamond character (◆) in the footprint diagrams Figure 17 and Figure 18.

TQ144: 144-lead Thin Quad Flat Package

The XC3S50A is available in the 144-lead thin quad flat package, TQ144.

Table 66 lists all the package pins. They are sorted by bank number and then by pin name. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The XC3S50A does not support the address output pins for the Byte-wide Peripheral Interface (BPI) configuration mode.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at

User I/Os by Bank

Table 67 indicates how the 108 available user-I/O pins are distributed between the four I/O banks on the TQ144 package. The AWAKE pin is counted as a Dual-Purpose I/O.

Footprint Migration Differences

The XC3S50A FPGA is the only Spartan-3A device offered in the TQ144 package.

FT256: 256-ball Fine-pitch, Thin Ball Grid Array

The 256-ball fine-pitch, thin ball grid array package, FT256, supports all five Spartan-3A FPGAs. The XC3S200A and XC3S400A have identical footprints, and the XC3S700A and XC3S1400A have identical footprints. The XC3S50A is compatible with the XC3S200A/XC3S400A but has 51 unconnected balls. The XC3S200A/XC3S400A is similar to the XC3S700A/XC3S1400A but the XC3S700A/XC3S1400A adds more power and ground pins.

Table 68 lists all the package pins for the XC3S50A, XC3S200A, and XC3S400A. They are sorted by bank number and then by pin name of the largest device. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The highlighted rows indicate pinout differences between the XC3S50A, the XC3S200A, and the XC3S400A FPGAs. The XC3S50A has 51 unconnected balls, indicated as N.C. (No Connection) in Table 68 and Figure 20 and with the black diamond character (◆) in Table 68. Figure 21 provides the common footprint for the XC3S200A and XC3S400A.

Table 68 also indicates that some differential I/O pairs have different assignments between the XC3S50A and the XC3S200A/XC3S400A, highlighted in light blue. See "Footprint Migration Differences," page 96 for additional information.

All other balls have nearly identical functionality on all three devices. Table 73 summarizes the XC3S50A FPGA footprint migration differences for the FT256 package.

The XC3S50A does not support the address output pins for the Byte-wide Peripheral Interface (BPI) configuration mode.

Table 69 lists all the package pins for the XC3S700A and XC3S1400A. They are sorted by bank number and then by pin name. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier. Figure 22 provides the common footprint for the XC3S200A and XC3S400A.

User I/Os by Bank

Table 70, Table 71, and Table 72 indicate how the available user-I/O pins are distributed between the four I/O banks on the FT256 package. The AWAKE pin is counted as a Dual-Purpose I/O.

The XC3S50A FPGA in the FT256 package has 51 unconnected balls, labeled with an "N.C." type. These pins are also indicated in Figure 20.

Footprint Migration Differences

Unconnected Balls on XC3S50A

Table 73 summarizes any footprint and functionality differences between the XC3S50A and the XC3S200A or XC3S400A FPGAs that might affect easy migration between these devices in the FT256 package. The XC3S200A and XC3S400A have identical pinouts. The XC3S50A pinout is compatible, but there are 52 balls that are different. Generally, designs easily migrate upward from the XC3S50A to either the XC3S200A or XC3S400A. If using differential I/O, see Table 74. If using the BPI configuration mode (parallel Flash), see Table 75.

This pin can unconditionally migrate from the device on the left to the device on the right. Migration in the other direction is possible depending on how the pin is configured for the device on the right.

XC3S50A Differential I/O Alignment Differences

Also, some differential I/O pairs on the XC3S50A FPGA are aligned differently than the corresponding pairs on the XC3S200A or XC3S400A FPGAs, as shown in Table 74. All the mismatched pairs are in I/O Bank 2. The shading highlights the N side of each pair.

XC3S50A Does Not Have BPI Mode Address Outputs

The XC3S50A FPGA does not generate the BPI-mode address pins during configuration. [Table 75](#) summarizes these differences.

Differences Between XC3S200A/XC3S400A and XC3S700A/XC3S1400A

The XC3S700A and XC3S1400A FPGAs have several additional power and ground pins as compared to the XC3S200A and XC3S400A. Table 76 summarizes all the differences. All dedicated and dual-purpose configuration pins are in the same location.

FG320: 320-ball Fine-pitch Ball Grid Array

The 320-ball fine-pitch ball grid array package, FG320, supports two Spartan-3A FPGAs, the XC3S200A and the XC3S400A, as shown in [Table 77](#) and [Figure 23](#).

The FG320 package is an 18 x 18 array of solder balls minus the four center balls.

[Table 77](#) lists all the package pins. They are sorted by bank number and then by pin name of the largest device. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The shaded rows indicate pinout differences between the XC3S200A and the XC3S400A FPGAs. The XC3S200A has three unconnected balls, indicated as N.C. (No Connection) in [Table 77](#) and with the black diamond character (◆) in [Table 77](#) and [Figure 23](#).

All other balls have nearly identical functionality on all three devices. [Table 80](#) summarizes the Spartan-3A FPGA footprint migration differences for the FG320 package.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at

www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip.

User I/Os by Bank

Table 78 and Table 79 indicate how the available user-I/O pins are distributed between the four I/O banks on the FG320 package. The AWAKE pin is counted as a Dual-Purpose I/O.

Table 78: User I/Os Per Bank for XC3S200A in the FG320 Package

Footprint Migration Differences

Table 80 summarizes any footprint and functionality differences between the XC3S200A and the XC3S400A FPGAs that might affect easy migration between devices available in the FG320 package. There are three such balls. All other pins not listed in Table 80 unconditionally migrate between Spartan-3A devices available in the FG320 package.

The arrows indicate the direction for easy migration.

Table 80: FG320 Footprint Migration Differences

| Pin | Bank | XC3S200A | Migration | XC3S400A |
|--------------------|------|----------|-----------|------------|
| E13 | 0 | N.C. | → | INPUT |
| N7 | 2 | N.C. | → | INPUT |
| P14 | 2 | N.C. | → | INPUT/VREF |
| DIFFERENCES | | | 3 | |

Legend:

- This pin can unconditionally migrate from the device on the left to the device on the right. Migration in the other direction is possible depending on how the pin is configured for the device on the right.

FG320 Footprint

| | | | | | |
|---------|---|----|--|---------|---|
| 101 | I/O: Unrestricted, general-purpose user I/O | 52 | DUAL: Configuration, AWAKE pins, then possible user-I/O | 23 - 24 | VREF: User I/O or input voltage reference for bank |
| 40 - 42 | INPUT: Unrestricted, general-purpose input pin | 32 | CLK: User I/O, input, or global buffer input | 16 | VCCO: Output voltage supply for bank |
| 3 | CONFIG: Dedicated configuration pins, SUSPEND pin | 4 | JTAG: Dedicated JTAG port pins | 6 | VCCINT: Internal core supply voltage (+1.2V) |
| 3 | N.C.: Not connected. Only the XC3S200A has these pins (◆). | 32 | GND: Ground | 8 | VCCAUX: Auxiliary supply voltage |

FG400: 400-ball Fine-pitch Ball Grid Array

The 400-ball fine-pitch ball grid array, FG400, supports two different Spartan-3A FPGAs, the XC3S400A and the XC3S700A. Both devices share a common footprint for this package as shown in [Table 81](#) and [Figure 24](#).

[Table 81](#) lists all the FG400 package pins. They are sorted by bank number and then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at

www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip.

User I/Os by Bank

Table 82 indicates how the 311 available user-I/O pins are distributed between the four I/O banks on the FG400 package. The AWAKE pin is counted as a Dual-Purpose I/O.

Footprint Migration Differences

The XC3S400A and XC3S700A FPGAs have identical footprints in the FG400 package. Designs can migrate between the XC3S400A and XC3S700A FPGAs without further consideration.

FG484: 484-ball Fine-pitch Ball Grid Array

The 484-ball fine-pitch ball grid array, FG484, supports both the XC3S700A and the XC3S1400A FPGAs. There are three pinout differences, as described in [Table 86](#).

[Table 83](#) lists all the FG484 package pins. They are sorted by bank number and then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The shaded rows indicate pinout differences between the XC3S700A and the XC3S1400A FPGAs. The XC3S700A has three unconnected balls, indicated as N.C. (No Connection) in [Table 83](#) and with the black diamond character (◆) in [Table 83](#) and [Figure 25](#).

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at

www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip.

User I/Os by Bank

Table 84 and Table 85 indicate how the user-I/O pins are distributed between the four I/O banks on the FG484

package. The AWAKE pin is counted as a Dual-Purpose I/O.

Footprint Migration Differences

Table 86 summarizes any footprint and functionality differences between the XC3S700A and the XC3S1400A FPGAs that might affect easy migration between devices available in the FG484 package. There are three such balls. All other pins not listed in Table 86 unconditionally migrate between Spartan-3A devices available in the FG484 package.

The arrows indicate the direction for easy migration.

Legend:

- This pin can unconditionally migrate from the device on the left to the device on the right. Migration in the other direction is possible depending on how the pin is configured for the device on the right.

FG676: 676-ball Fine-pitch Ball Grid Array

The 676-ball fine-pitch ball grid array, FG676, supports the XC3S1400A FPGA.

Table 87 lists all the FG676 package pins. They are sorted by bank number and then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The XC3S1400A has 17 unconnected balls, indicated as N.C. (No Connection) in Table 87 and with the black diamond character (◆) in Table 87 and Figure 26.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at

www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip.

User I/Os by Bank

Table 88 indicates how the 502 available user-I/O pins are distributed between the four I/O banks on the FG676 package. The AWAKE pin is counted as a Dual-Purpose I/O.

Table 88: User I/Os Per Bank for the XC3S1400A in the FG676 Package

Footprint Migration Differences

The XC3S1400A FPGA is the only Spartan-3A device offered in the FG676 package. However, [Table 89](#) summarizes footprint and functionality differences between the XC3S1400A and the XC3SD1800A in the Spartan-3A DSP platform. There are 17 unconnected balls in the XC3S1400A that become 16 input-only pins and one I/O pin in the XC3SD1800A. All other pins not listed in [Table 89](#) unconditionally migrate between the Spartan-3A platform devices and the Spartan-3A DSP platform devices available in the FG676 package. The arrows indicate the direction for easy migration. For more details on the Spartan-3A DSP platform and pinouts, and additional differences in the FG676 pinout for the XC3SD3400A device, see [DS610](#).

Legend:

- This pin can unconditionally migrate from the device on the left to the device on the right. Migration in the other direction is possible depending on how the pin is configured for the device on the right.

Revision History

The following table shows the revision history for this document.

| Date | Version | Revision |
|----------|---------|--|
| 12/05/06 | 1.0 | Initial release. |
| 02/02/07 | 1.1 | Promoted to Preliminary status. Added DOUT pin to DUAL-type pins in Table 57 . Corrected counts for DUAL pins and differential pairs in Table 59 . Corrected minor typographical error on pin names for pin numbers P24 and P25 in Table 66 . Highlighted the differences in differential I/O pairs between the XC3S50A and XC3S200A in the FT256 package, shown in Table 68 and added Table 74 and Table 75 to summarize the differences. |
| 03/16/07 | 1.2 | Corrected minor typographical error in Figure 19 . |
| 04/23/07 | 1.3 | Added reference to compatible Spartan-3A DSP family. |
| 05/08/07 | 1.4 | Added note regarding banking rules. |
| 07/10/07 | 1.5 | Updated Thermal Characteristics in Table 62 . |
| 04/15/08 | 1.6 | Added VQ100 for XC3S50A and XC3S200A and added FT256 for XC3S700A and XCS1400A to Table 58 , Table 59 , and Table 62 . Updated Thermal Characteristics with latest data in Table 62 . Corrected bank for T8 and type for U16 in Table 86 . Removed VREF name on 6 unconnected N.C. pins for XC3S1400A FG676 in Table 87 and Figure 26 . These pins are noted as VREF if migrating up to the XC3SD1800A in Table 89 . |
| 05/28/08 | 1.7 | Added " Package Overview " section. |
