

8-BIT ADDRESSABLE LATCH

FEATURES

- Combines demultiplexer and 8-bit latch
- Serial-to-parallel capability
- Output from each storage bit available
- Random (addressable) data entry
- Easily expandable
- Common reset input
- Useful as a 3-to-8 active HIGH decoder
- Output capability: standard
- I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT259 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A. The 74HC/HCT259 are high-speed 8-bit addressable latches designed for general purpose storage applications in digital systems. The "259" are multifunctional devices capable of storing single-line data in eight addressable latches, and also 3-to-8 decoder and demultiplexer, with active HIGH outputs (Q_0 to Q_7), functions are available.

The "259" also incorporates an active LOW common reset (MR) for resetting all latches, as well as, an active LOW enable input (LE).

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t_{PHL}/t_{PLH}	propagation delay D to Q_n A_n , LE to Q_n \overline{MR} to Q_n	$C_L = 15 \text{ pF}$ $V_{CC} = 5 \text{ V}$	18 17 15	20 20 20	ns ns ns
C_I	input capacitance		3.5	3.5	pF
CPD	power dissipation capacitance per latch	notes 1 and 2	19	19	pF

$GND = 0 \text{ V}$; $T_{amb} = 25^\circ\text{C}$; $t_r = t_f = 6 \text{ ns}$

Notes

1. CPD is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = CPD \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$$

f_i = input frequency in MHz

C_L = output load capacitance in pF

f_o = output frequency in MHz

V_{CC} = supply voltage in V

$\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs

2. For HC the condition is $V_I = GND$ to V_{CC}

For HCT the condition is $V_I = GND$ to $V_{CC} - 1.5 \text{ V}$

PACKAGE OUTLINES

16-lead DIL; plastic (SOT38Z).

16-lead mini-pack; plastic (SO16; SOT109A).

MODE SELECT TABLE

LE	MR	MODE
L	H	addressable latch
H	H	memory
L	L	active HIGH 8-channel demultiplexer
H	L	reset

GENERAL DESCRIPTION

The "259" has four modes of operation as shown in the mode select table.

In the addressable latch mode, data on the data line (D) is written into the addressed latch. The addressed latch will follow the data input with all non-addressed latches remaining in their previous states. In the memory mode, all latches remain in their previous states and are unaffected by the data or address inputs.

In the 3-to-8 decoding or demultiplexing mode, the addressed output follows the state of the D input with all other outputs in the LOW state. In the reset mode all outputs are LOW and unaffected by the address (A₀ to A₂) and data (D) input. When operating the "259" as an addressable latch, changing more than one bit of address could impose a transient-wrong address. Therefore, this should only be done while in the memory mode. The mode select table summarizes the operations of the "259".
