

## Nonvolatile Static RAM

1

### FEATURES

- Single 5V Supply
- Fully TTL Compatible
- Infinite E<sup>2</sup>PROM Array Recall, RAM Read and Write Cycles
- Access Time of 300 ns Max.
- Nonvolatile Store Inhibit:  $V_{CC} = 3V$  Typical
- High Reliability
  - Store Cycles: 10,000
  - Data Retention: 100 Years

### DESCRIPTION

The Xicor X2201A is a 1024 x 1 NOVRAM featuring a high-speed static RAM overlaid bit-for-bit with a nonvolatile E<sup>2</sup>PROM. The X2201A is fabricated with the same reliable N-channel floating gate MOS technology used in all Xicor 5V nonvolatile memories.

The NOVRAM design allows data to be easily transferred from RAM to E<sup>2</sup>PROM (store) and from E<sup>2</sup>PROM to RAM (recall). The store operation is completed in 10 ms or less and the recall is typically completed in 1  $\mu$ s.

Xicor NOVRAMs are designed for unlimited write operations to RAM, either from the host or recalls from E<sup>2</sup>PROM. The E<sup>2</sup>PROM array is designed for a minimum 10,000 store cycles and inherent data retention is specified to be greater than 100 years. Refer to RR-520 and RR-515 for details on Xicor nonvolatile memory endurance and data retention characteristics.

## ABSOLUTE MAXIMUM RATINGS\*

Temperature Under Bias	-10°C to +85°C
Storage Temperature	-65°C to +150°C
Voltage on any Pin with Respect to Ground	-1.0V to +7V
D.C. Output Current	5 mA
Lead Temperature (Soldering, 10 Seconds)	300°C

## \*COMMENT

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and the functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## PIN DESCRIPTIONS AND DEVICE OPERATION

### Addresses ( $A_0$ – $A_9$ )

The address inputs select a memory location during a read or write operation.

### Chip Select ( $\overline{CS}$ )

The Chip Select input must be LOW to enable read/write operations with the RAM array.  $\overline{CS}$  HIGH will place the  $D_{OUT}$  in the high impedance state.

### Write Enable ( $\overline{WE}$ )

The Write Enable input controls the  $D_{OUT}$  buffer, determining whether a RAM read or write operation is enabled.  $\overline{WE}$  HIGH enables a read and  $\overline{WE}$  LOW enables a write.

### Data In ( $D_{IN}$ )

Data is written into the device via the  $D_{IN}$  input.

### Data Out ( $D_{OUT}$ )

Data from a selected address is output on the  $D_{OUT}$  output. This pin is in the high impedance state when either  $\overline{CS}$  is HIGH or when  $\overline{WE}$  is LOW.

### STORE

The  $\overline{STORE}$  input, when LOW, will initiate the transfer of the entire contents of the RAM array to the E<sup>2</sup>PROM array. The  $\overline{WE}$  and  $\overline{ARRAY\ RECALL}$  inputs are inhibited during the store cycle. The store operation will be completed in 10 ms or less.

A store operation has priority over RAM read/write operations. If  $\overline{STORE}$  is asserted during a read operation, the read will be discontinued. If  $\overline{STORE}$  is asserted during a RAM write operation, the write will be immediately terminated and the store performed. The data at the RAM address that was being written will be unknown in both the RAM and E<sup>2</sup>PROM.

### ARRAY RECALL

The  $\overline{ARRAY\ RECALL}$  input, when LOW, will initiate the transfer of the entire contents of the E<sup>2</sup>PROM array to the RAM array. The transfer of data will typically be completed in 1  $\mu$ s or less.

An array recall has priority over RAM read/write operations and will terminate both operations when  $\overline{ARRAY\ RECALL}$  is asserted.  $\overline{ARRAY\ RECALL}$  LOW will also inhibit the  $\overline{STORE}$  input.

## WRITE PROTECTION

The X2201A has three write protect features that are employed to protect the contents of the nonvolatile memory.

- $V_{CC}$  Sense—All functions are inhibited when  $V_{CC}$  is  $\leq 3V$ , typically.
- Write Inhibit—Holding either  $\overline{STORE}$  HIGH or  $\overline{ARRAY\ RECALL}$  LOW during power-up or power-down will prevent an inadvertent store operation and E<sup>2</sup>PROM data integrity will be maintained. It should be noted; whichever method is employed, all control inputs should be stable and the device deselected prior to release of the controlling protection signal.
- Noise Protection—A  $\overline{STORE}$  pulse of less than 20 ns (typical) will *not* initiate a store cycle.
