

## IO-Link Device Transceiver

### Functional Diagram

## IO-Link Device Transceiver

### ABSOLUTE MAXIMUM RATINGS

(All voltages referenced to GND, unless otherwise noted.)

V <sub>CC</sub> .....	-40V to +40V
V <sub>P</sub> (I <sub>YP</sub> < 50mA) .....	the higher of -0.3V and (V <sub>CC</sub> - 1V) to +40V
LDOIN.....	-0.3V to +40V
V <sub>5</sub> .....	-0.3V to the lesser of (V <sub>LDOIN</sub> + 0.3V) and +6V
LDO33 .....	-0.3V to the lesser of (V <sub>5</sub> + 0.3V) and +6V
V <sub>L</sub> .....	-0.3V to +6V
DI .....	-40V to +40V
C/Q, DO.....	MIN: the higher of -40V and (V <sub>CC</sub> - 40V) MAX: the lesser of +40V and (V <sub>CC</sub> + 40V)

#### Logic Inputs

TXC, TXQ, TXEN, LO,  $\overline{CS}$ , SDI, SCLK..... -0.3V to (V<sub>L</sub> + 0.3V)

#### Logic Outputs

RX, WU, LI, SDO, $\overline{IRQ}$ .....	-0.3V to (V <sub>L</sub> + 0.3V)
UV .....	-0.3V to +6V
Continuous Current Into Any Logic Pin.....	±50mA
Continuous Power Dissipation	
TQFN (derate 27.8mW/°C above +70°C).....	2222mW
Operating Temperature Range .....	-40°C to +85°C
Maximum Junction Temperature.....	+150°C
Storage Temperature Range.....	-65°C to +150°C
Lead Temperature (soldering, 10s) .....	+300°C
Soldering Temperature (reflow) .....	+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### PACKAGE THERMAL CHARACTERISTICS (Note 1)

#### TQFN

Junction-to-Ambient Thermal Resistance ( $\theta_{JA}$ ) .....36°C/W

Junction-to-Case Thermal Resistance ( $\theta_{JC}$ ) .....3°C/W

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maxim-ic.com/thermal-tutorial](http://www.maxim-ic.com/thermal-tutorial).

### DC ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = 18V to 36V, V<sub>L</sub> = 2.3V to 5.5V, V<sub>GND</sub> = 0V; all logic inputs at V<sub>L</sub> or GND; T<sub>A</sub> = -40°C to +85°C, unless otherwise noted. Typical values are at V<sub>CC</sub> = 24V, V<sub>L</sub> = 3.3V, and T<sub>A</sub> = +25°C, unless otherwise noted.) (Note 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
V <sub>CC</sub> Supply Voltage	V <sub>CC</sub>	For driver operation	9		36	V
V <sub>CC</sub> Supply Current	I <sub>CC</sub>	V <sub>CC</sub> = 24V, C/Q as input, no load on V <sub>5</sub> or LDO33, LDOIN not connected to V <sub>P</sub> , V <sub>LDOIN</sub> = 24V		1	2.5	mA
V <sub>CC</sub> Undervoltage Lockout Threshold	V <sub>CCUVLO</sub>	V <sub>CC</sub> falling	6	7.4	9	V

## IO-Link Device Transceiver

### Pin Configuration

### Pin Description

PIN	NAME	FUNCTION
1	LDOIN	5V Linear Regulator Input. Bypass LDOIN to GND with a 0.1 $\mu$ F ceramic capacitor.
2	V <sub>5</sub>	5V Power-Supply Input and 5V Linear Regulator Output. Bypass V <sub>5</sub> to GND with a 0.1 $\mu$ F ceramic capacitor for 10mA load capability. Add the recommended compensation network to increase the source capability to 30mA. See the <i>5V and 3.3V Linear Regulators</i> section for more information.
3	LDO33	3.3V Linear Regulator Output. Bypass LDO33 to GND with a 1 $\mu$ F ceramic capacitor.
4	$\overline{\text{IRQ}}$	Active-Low Interrupt Request Output. $\overline{\text{IRQ}}$ is a push-pull output referenced to V <sub>L</sub> .
5	SCLK	SPI Clock Input
6	$\overline{\text{CS}}$	Active-Low SPI Chip-Select Input
7	SDO	SPI Serial-Data Output
8	SDI	SPI Serial-Data Input
9	V <sub>L</sub>	Logic-Level Supply Input. V <sub>L</sub> defines the logic levels on all the logic inputs and outputs. Bypass V <sub>L</sub> to GND with a 0.1 $\mu$ F ceramic capacitor.
10	I.C.	Internally Connected. Connect to V <sub>L</sub> or leave unconnected. It is recommended to connect to V <sub>L</sub> .
11	TXQ	Transmit Level Input. The logic on the C/Q output is the inverse logic level of the signals on the TXC and TXQ inputs. TXQ is ANDed with TXC. Drive TXQ high if not in use.
12	TXC	Transmit Communication Input. The logic on the C/Q output is the inverse logic level of the signals on the TXC and TXQ inputs. TXC is ANDed with TXQ. Drive TXC high if not in use.
13	TXEN	Transmitter Enable. Drive TXEN high to enable the C/Q transmitter. TXEN is referenced to V <sub>L</sub> .

**IO-Link Device Transceiver****Pin Description (continued)**

PIN	NAME	FUNCTION
14	RX	Receiver Output. RX is the inverse logic level of C/Q. RX is always high when the RxDis bit in the CQConfig register is set to 1.
15	$\overline{WU}$	Active-Low Wake-Up Output. $\overline{WU}$ is a push-pull output referenced to $V_L$ . $\overline{WU}$ pulses low for 190 $\mu$ s (typ) when a valid wake-up pulse is detected on the C/Q line.
16	LO	Logic Input of the DO Output. LO is the logic input that drives DO. LO is referenced to $V_L$ .
17	LI	Logic Output of the 24V DI Logic Input. LI is the inverse logic of DI. LI is referenced to $V_L$ .
18	UV	Open-Drain Undervoltage Indicator Output. In case of an undervoltage, the UV open-drain transistor is off.
19	DI	24V Logic-Level Digital Input
20	GND	Ground
21	C/Q	SIO/IO-Link Data Input/Output. Drive TXEN high to enable the C/Q driver. The logic on the C/Q output is the inverse logic level of the signals on the TXC and TXQ inputs. RX is the logic inverse of C/Q. The C/Q driver output level can be set by the TXC/TXQ inputs or programmed by the Q bit. The level on C/Q can be read by the RX output or the $\overline{QLvl}$ bit.
22	DO	24V Logic-Level Digital Output. DO is the inverse logic level of the LO input and can be digitally controlled through the DIOConfig register.
23	$V_{CC}$	Power-Supply Input. Bypass $V_{CC}$ to GND with a 1 $\mu$ F ceramic capacitor.
24	$V_P$	Protected 24V Supply Output. $V_P$ is one diode drop below $V_{CC}$ . $V_P$ is reverse-polarity protected and can be used as a 24V protected supply to the sensor or actuator electronics.
—	EP	Exposed Pad. Connect EP to GND.

# IO-Link Device Transceiver

## Detailed Description

The MAX14820 is a sensor/actuator transceiver designed for IO-Link® device applications supporting all the specified IO-Link data rates. In IO-Link applications, the devices act as the physical layer interface to a microcontroller running the data-link layer protocol. The device contains an additional 24V digital input and an additional 24V digital output. Two internal linear regulators generate common sensor and actuator power requirements: 5V and 3.3V.

The device detects IO-Link wake-up conditions on the C/Q line and generates a wake-up signal on the WU output. The C/Q and DO drivers are independently configurable to any one of three driver output types: push-pull, high-side (PNP), or low-side (NPN).

The C/Q and DI inputs have selectable current sinks that can be enabled for use in actuators where the master requires a Type 2 load. These devices are configured and monitored through an SPI™ interface. Extensive alarms are available through SPI.

### 24V Interface

The device features an IO-transceiver interface capable of operating with voltages up to 36V. This is the 24V interface and includes the C/Q input/output, the logic-level digital output (DO), and the logic-level digital input (DI).

### Configurable Drivers

The device features selectable push-pull, high-side (PNP), or low-side (NPN) switching drivers at C/Q and DO.

Set the C/Q\_N/P and C/Q\_PP bits in the CQConfig register to select the driver mode for the C/Q driver. When configured as a push-pull output, C/Q switches between  $V_P$  and ground. Set the C/Q\_PP bit to 1 to select push-pull operation at C/Q. Set the C/Q\_PP bit to 0 to configure the C/Q output for open-drain operation. The C/Q\_N/P bit selects NPN or PNP operation when C/Q is configured as an open-drain output.

Set the DoN/P and DoPP bits in the DIOConfig register to select the driver mode for the DO output. When configured as a push-pull output, DO switches between  $V_{CC}$  and ground. Set the DoPP bit to 1 for push-pull operation. The DoN/P bit selects NPN or PNP operation when DO is configured as an open-drain output. Set the DoPP bit to 0 to select high-side or low-side operation at DO.

*IO-Link is a registered trademark of ifm electronic GmbH.*

*SPI is a trademark of Motorola, Inc.*

### C/Q Driver and Receiver

The TXEN input enables the C/Q driver. Drive TXEN high to enable the C/Q driver. Drive TXEN low to disable the driver.

The device's C/Q driver is specified for 300mA to drive large capacitive loads of up to 1 $\mu$ F and dynamic impedances like incandescent lamps. The maximum load current for C/Q is limited to 480mA.

The HiSlew bit increases the slew rate of the C/Q and DO driver outputs. Set HiSlew to 1 for data rates of 230kbps or higher. Set HiSlew to 0 to reduce both the C/Q and DO driver slew rates to reduce EMI emission and reflections.

The C/Q receiver is always on. Disable the RX output through the RxDis bit in the CQConfig register. Set the RxDis bit to 1 to set the RX output high. Set the RxDis bit to 0 for normal receive operation.

The C/Q receiver has an analog lowpass filter to reduce high-frequency noise present on the line. Set the RxFilter bit in the CQConfig register to 0 to set the filter corner frequency to 500kHz (typ). Set the RxFilter bit to 1 to set the corner frequency of the filter to 1MHz (typ). Noise filters are present on both the C/Q and DI receivers and are controlled simultaneously by the RxFilter bit.

### C/Q Fault Detection

The device registers a C/QFault condition under either of two conditions:

- 1) When it detects a short circuit for longer than 160 $\mu$ s (typ). A short condition exists when the C/Q driver's load current exceeds the 375mA (typ) current limit.
- 2) When it detects a voltage level error at the C/Q output. A voltage level error occurs when the C/Q driver is configured for open-drain operation (NPN or PNP), the driver is turned off, and the C/Q voltage is not pulled to exceed the C/Q receiver's threshold levels (< 8V or > 13V) by the external supply.

When a C/QFault error occurs, the C/QFault and C/QFaultInt bits are set,  $\overline{IRQ}$  asserts, and the driver is turned off 240 $\mu$ s (typ) after the start of the fault condition.

When a short-circuit event occurs on C/Q, the driver enters autoretry mode. In autoretry mode the device periodically checks whether the short is still present and attempts to correct the driver output. Autoretry attempts last for 350 $\mu$ s (typ) and occur every 26ms (typ).

## IO-Link Device Transceiver

### DO Fault Detection

The device registers a DoFault event when a short circuit is present at the DO output for 440 $\mu$ s. A short condition exists when the load current on the DO driver exceeds the 200mA (typ) DO current limit. When a short-circuit condition is detected, the DO driver enters autoretry mode. In autoretry mode the device periodically checks whether the error is still present. Autoretry attempts last for 440 $\mu$ s (typ) and occur every 26ms (typ). When a DoFault error is detected, the DoFault and DoFaultInt bits are set,  $\overline{\text{IRQ}}$  asserts, and the driver is turned off 440 $\mu$ s (typ) after the start of the DO faults.

### Reverse-Polarity Protection

The device is protected against reverse-polarity connections on  $V_{CC}$ , C/Q, DO, DI, and GND. Any combination of these pins can be connected to DC voltages up to 40V (max). A short to 40V results in a current flow of less than 500 $\mu$ A.

Ensure that the maximum voltage between any of these pins does not exceed 40V.

### 5V and 3.3V Linear Regulators

The device includes two internal current-limited regulators to generate 5V ( $V_5$ ) and 3.3V (LDO33).  $V_5$  is specified at 10mA when bypassed with a 0.1 $\mu$ F capacitor to ground. Add the compensation network shown in Figure 7 to draw up to 30mA from  $V_5$ . LDO33 is specified at 20mA. The input of  $V_5$ , LDOIN, can be connected to  $V_P$ , the protected 24V supply output, or to another voltage in the 7V to 36V range.

$V_5$  constitutes the supply for the logic block. The 5V LDO can be disabled by connecting LDOIN to  $V_5$ . Apply an external voltage from 4.75V to 5.25V to  $V_5$  when the LDO is disabled.

Figure 7.  $V_5$  Compensation Network

Use the LDO33Dis bit in the Mode register to enable/disable LDO33. See the [Mode Register \[R1, R0\] = \[1, 1\]](#) section for more information.  $V_5$  and LDO33 are not protected against short circuits.

### Power-Up

The C/Q and DO driver outputs and the UV output are high impedance when  $V_{CC}$ ,  $V_5$ ,  $V_L$ , and/or LDO33 voltages are below their respective undervoltage thresholds during power-up. UV goes low and the drivers are enabled when all these voltages exceed their respective undervoltage lockout thresholds.

The drivers are automatically disabled if  $V_{CC}$ ,  $V_5$ , or  $V_L$  falls below its threshold.

### Undervoltage Detection

The device monitors  $V_{CC}$ ,  $V_5$ ,  $V_L$ , and optionally LDO33 for undervoltage conditions. UV is high impedance when any monitored voltage falls below its UVLO threshold.

$V_{CC}$ ,  $V_5$ , and  $V_L$  undervoltage detection cannot be disabled. When  $V_{CC}$  falls below the  $V_{CCUVLO}$  threshold, the UV24 and UV24Int bits are set, UV asserts high, and  $\overline{\text{IRQ}}$  asserts low.

The SPI register contents are unchanged while  $V_5$  is present, regardless of the state of  $V_{CC}$  and LDO33. The SPI interface is not accessible and  $\overline{\text{IRQ}}$  is not available when UV is asserted due to a  $V_5$  or  $V_L$  undervoltage event.

When the internal 3.3V LDO regulator voltage ( $V_{LDO33}$ ) falls below the LDO33 undervoltage lockout threshold, the UV33Int bit in the Status register is set and  $\overline{\text{IRQ}}$  asserts. UV asserts if the UV33En bit in the Mode register is set to 1.

The UV output deasserts once the undervoltage condition is removed; however, bits in the Status register and the  $\overline{\text{IRQ}}$  output are not cleared until the Status register has been read.

### Wake-Up Detection

The device detects an IO-Link wake-up condition on the C/Q line in push-pull, high-side (PNP), or low-side (NPN) operation modes. A wake-up condition is detected when the C/Q output is shorted for 80 $\mu$ s (typ).  $\overline{\text{WU}}$  pulses low for 190 $\mu$ s (typ) when the device detects a wake-up pulse on C/Q (Figure 5).

Set the WulntEn bit in the Mode register to set the Wulnt bit in the Status register and generate an interrupt on  $\overline{\text{IRQ}}$  when a wake-up pulse is detected. Wulnt is set and  $\overline{\text{IRQ}}$  asserts immediately after C/Q is released when WulntEn = 1.

## IO-Link Device Transceiver

### Thermal Protection and Considerations

The internal LDOs and drivers can generate more power than the package for the devices can safely dissipate. Ensure that the driver LDO loading is less than the package can dissipate. Total power dissipation for the device is calculated using the following equation:

$$P_{TOTAL} = P_{C/Q} + P_{DO} + P_5 + P_{LDO33} + P_Q + P_{CLCQ} + P_{CLDI}$$

where  $P_{C/Q}$  is the power generated in the C/Q driver,  $P_{DO}$  is the power dissipated by the DO driver,  $P_5$  and  $P_{LDO33}$  are the power generated by the LDOs,  $P_Q$  is the quiescent power generated by the devices, and  $P_{CLCQ}$  and  $P_{CLDI}$  are the power generated in the C/Q and DI current sinks.

Ensure that the total power dissipation is less than the limits listed in the [Absolute Maximum Ratings](#) section.

Use the following to calculate the power dissipation (in mW) due to the C/Q driver:

$$P_{C/Q} = [I_{C/Q(max)}] \times [0.5 + 7 \times I_{C/Q(max)}]$$

Calculate the internal power dissipation of the DO driver using the following equation:

$$P_{DO} = [I_{DO(max)}] \times [0.5 + 7 \times I_{DO(max)}]$$

Calculate the power dissipation in the 5V LDO, V5, using the following equation:

$$P_5 = (V_{LDOIN} - V_5) \times I_5$$

where  $I_5$  includes the  $I_{LDO33}$  current sourced from LDO33.

Calculate the power dissipated in the 3.3V LDO, LDO33, using the following equation:

$$P_{LDO33} = 1.7V \times I_{LDO33}$$

Calculate the quiescent power dissipation in the device using the following equation:

$$P_Q = 5mA \times V_{CC(max)}$$

If the current sinks are enabled, calculate their associated power dissipation as:

$$P_{CLCQ} = 7mA \times V_{C/Q(max)}$$

$$P_{CLDI} = 7mA \times V_{DI(max)}$$

### Overtemperature Warning

Bits in the Status and Mode registers are set when the temperature of the device exceeds +115°C (typ). The  $OTempInt$  bit in the Status register is set and  $\overline{IRQ}$  asserts when the  $OTemp$  bit in the Mode register is set. Read the Status register to clear the  $OTempInt$  bit and  $\overline{IRQ}$ .

The  $OTemp$  bit is cleared when the die temperature falls to +95°C.

The device continues to operate normally unless the die temperature reaches the +150°C thermal shutdown threshold, when the device enters thermal shutdown.

### Thermal Shutdown

All regulators and the C/Q and DO output drivers are automatically switched off when the internal die temperature exceeds the +150°C (typ) thermal shutdown threshold. SPI communication is not available during a thermal shutdown event.

Regulators are automatically switched on when the internal die temperature falls below the thermal shutdown threshold plus hysteresis. The internal registers return to their default state when the V5 regulator is switched on.

## IO-Link Device Transceiver

### Register Functionality

The devices have four 8-bit-wide registers for configuration and monitoring ([Table 1](#)).

**Table 1. Register Summary**

REGISTER	R1	R0	D7	D6	D5	D4	D3	D2	D1	D0
Status	0	0	Wulnt	DoFaultInt	DiLvl	$\overline{Q}$ Lvl	C/QFaultInt	UV33Int	UV24Int	OTemplnt
CQConfig	0	1	RxFilter	HiSlew	C/Q_N/P	C/Q_PP	C/QDEn	Q	RxDis	C/QLoad
DIOConfig	1	0	DoInv	DoAv	DoN/P	DoPP	DoEn	DoBit	LiDis	DiLoad
Mode	1	1	RST	WulntEn	DoFault	C/QFault	UV24	OTemp	UV33En	LDO33Dis

R1/R0 = Register address.

### Status Register [R1, R0] = [0,0]

Bit	D7	D6	D5	D4	D3	D2	D1	D0
<b>Bit Name</b>	Wulnt	DoFaultInt	DiLvl	$\overline{Q}$ Lvl	C/QFaultInt	UV33Int	UV24Int	OTemplnt
<b>Read/Write</b>	R	R	R	R	R	R	R	R
<b>POR State</b>	0	0	X	X	0	0	0	0
<b>Reset Upon Read</b>	Yes	Yes	No	No	Yes	Yes	Yes	Yes

X = Unknown. These bits are dependent on the DI logic and C/Q inputs.

The Status register reflects the logic levels of C/Q and DI and shows the source of interrupts that cause an  $\overline{IRQ}$  hardware interrupt. The  $\overline{IRQ}$  interrupt is asserted when an alarm condition (OTemp, UV33Int, UV24, C/QFault, DoFault, Wulnt) is detected. All bits in the Status register are read-only. The interrupt bits return to the default state after the Status register is read. If a C/Q or DO fault condition persists, the associated interrupt bits are immediately set after the Status register is read.

BIT	NAME	DESCRIPTION
D7	Wulnt	<b>Wake-Up Interrupt Request.</b> Wulnt is set when an IO-Link wake-up request pulse is detected on C/Q and the WulntEn bit in the Mode register is set. $\overline{IRQ}$ asserts when Wulnt is set to 1. Read the Status register to clear the Wulnt bit and deassert $\overline{IRQ}$ .
D6	DoFaultInt	<b>DO Fault Interrupt.</b> DoFaultInt interrupt bit and DoFault bit (in the Mode register) are set when a fault condition occurs on the DO driver output. The device registers a fault condition when a short circuit or voltage fault is detected on DO (see the <i>DO Fault Detection</i> section for more information). $\overline{IRQ}$ asserts when DoFaultInt is 1. Read the Status register to clear the DoFaultInt bit and deassert $\overline{IRQ}$ .
D5	DiLvl	<b>DI Logic Level.</b> The DiLvl bit mirrors the current logic level at the DI input. It is the inverse of the LI output and is always active regardless of the state of the LiDis bit (Table 2). DiLvl does not affect $\overline{IRQ}$ . DiLvl is not changed when the Status register is read.

## IO-Link Device Transceiver

BIT	NAME	DESCRIPTION
D4	$\overline{QLvl}$	<b>C/Q Logic Level.</b> The $\overline{QLvl}$ bit is the inverse of the logic level at C/Q. $\overline{QLvl}$ is 1 when the C/Q input level is low (< 8V) and is 0 when the C/Q logic level is high (> 13V) (Table 3). $\overline{QLvl}$ remains active when the C/Q receiver is disabled (RxDis = 1). $\overline{QLvl}$ does not affect $\overline{IRQ}$ . $\overline{QLvl}$ is not changed when the Status register is read.
D3	C/QFaultInt	<b>C/Q Fault Interrupt.</b> The C/QFaultInt interrupt bit and C/QFault bit (in the Mode register) are set when a short circuit or voltage fault occurs on the C/Q driver output (see the <i>C/Q Fault Detection</i> section for more information). $\overline{IRQ}$ asserts when C/QFault is 1. Read the Status register to clear the C/QFaultInt bit and deassert $\overline{IRQ}$ .
D2	UV33Int	<b>Internal 3.3V LDO (LDO33) Undervoltage Warning.</b> Both the UV33Int interrupt bit and the UV33En bit (in the Mode register) are set when $V_{LDO33}$ falls below the 2.4V LDO33 undervoltage threshold. If UV33En is set in the Mode register, $\overline{IRQ}$ asserts low when the UV33Int bit is 1. Read the Status register to clear the UV33Int bit and deassert $\overline{IRQ}$ . Set the UV33En bit to 1 in the Mode register to enable undervoltage monitoring for UV33Int. When enabled, UV asserts high when the UV33Int bit is 1. UV deasserts when $V_{LDO33}$ rises above the LDO33 undervoltage threshold.
D1	UV24Int	<b>V<sub>CC</sub> Undervoltage Interrupt.</b> The UV24Int interrupt bit and the UV24 bit (in the Mode register) are set when the $V_{CC}$ voltage falls below the 7.4V undervoltage threshold. $\overline{IRQ}$ asserts low when the UV24Int bit is 1. Read the Status register to clear the UV24Int bit and deassert $\overline{IRQ}$ . $V_{CC}$ undervoltage detection cannot be disabled.
D0	OTemplnt	<b>Overtemperature Warning.</b> The OTemplnt interrupt bit and the OTemp bit (in the Mode register) are set when a high-temperature condition is detected by the devices. OTemp is set when the temperature of the die exceeds +115°C (typ). OTemplnt is set and $\overline{IRQ}$ asserts when the OTemp bit is 1. The OTemplnt bit is cleared and $\overline{IRQ}$ deasserts when the Status register is read. Once cleared, OTemplnt is not reset if the die temperature remains above the thermal warning threshold and does not fall below +95°C.

**Table 2. DiLvl and LI Output**

V <sub>DI</sub> (V)	DiLvl BIT	LI OUTPUT
< 5.2	0	High
> 8	1	Low

**Table 3.  $\overline{QLvl}$  and RX Output**

V <sub>C/Q</sub> (V)	$\overline{QLvl}$ BIT	RX OUTPUT
< 8	1	High
> 13	0	Low

## IO-Link Device Transceiver

**CQConfig Register [R1, R0] = [0,1]**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
<b>Bit Name</b>	RxFilter	HiSlew	C/Q_N/P	C/Q_PP	C/QDEn	Q	RxDis	C/QLoad
<b>Read/Write</b>	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
<b>POR State</b>	0	0	0	0	0	0	0	0

Use the CQConfig register to control the C/Q receiver and driver parameters. All bits in the CQConfig register are read-write and are set to 0 at power-up.

BIT	NAME	DESCRIPTION
D7	RxFilter	<p><b>C/Q and DI Receiver Filter Control.</b> The C/Q and DI receivers have analog lowpass filters to reduce high-frequency noise on the receiver inputs. Set the RxFilter bit to 0 to set the filter corner frequency to 500kHz. Set the RxFilter bit to 1 to set the filter corner frequency to 1MHz (this setting is used for high-speed COM3 operation).</p> <p>Noise filters on C/Q and DI are controlled simultaneously by the RxFilter bit.</p>
D6	HiSlew	<p><b>Slew-Rate Control.</b> The HiSlew bit increases the slew rate for the C/Q and DO drivers and is used for high-speed COM3 (230kbps) data rates. Set HiSlew to 0 for COM1 and COM2 operation.</p>
D5	C/Q_N/P	<p><b>C/Q Driver NPN/PNP Mode.</b> The C/Q_N/P bit selects between low-side (NPN) and high-side (PNP) modes when the C/Q driver is configured as an open-drain output (C/Q_PP = 0). Set C/Q_N/P to 1 to configure the driver for low-side (NPN) operation. Set C/Q_N/P to 0 for high-side (PNP) operation.</p>
D4	C/Q_PP	<p><b>C/Q Driver Push-Pull Operation.</b> Set C/Q_PP to 1 to enable push-pull operation on the C/Q driver. The C/Q output is open-drain when C/Q_PP is 0.</p>
D3	C/QDEn	<p><b>C/Q Driver Enable/Disable.</b> Set the C/QDEn bit to 1 to enable the C/Q driver. Set C/QDEn to 0 for hardware (TXEN) control. See Table 4.</p>
D2	Q	<p><b>C/Q Driver Output Logic.</b> The Q bit can be used to program the C/Q output driver through software. The C/Q driver must be enabled and TXC = TXQ must be high to control the C/Q driver through the Q bit (Figure 8). C/Q has the same logic polarity as the Q bit.</p> <p>Set the Q bit to 0 to control the C/Q driver with TXC and TXQ.</p> <p>The C/Q driver output state depends on the C/Q_PP and C/Q_N/P bits as shown in Table 5. Note that Table 5 assumes that the C/Q driver is enabled (TXEN = V<sub>L</sub> or C/QDEn = 1).</p>
D1	RxDis	<p><b>C/Q Receiver Enable/Disable.</b> Set the RxDis bit to 1 to disable the C/Q receiver. The RX output is high when RxDis is 1.</p>
D0	C/QLoad	<p><b>C/Q Current Sink Enable.</b> Set the C/QLoad bit to 1 to enable the internal current sink at C/Q.</p>

## IO-Link Device Transceiver

**Table 4. C/QDn and TXEN C/Q Driver Control**

C/QDn	TXEN	C/Q DRIVER
0	Low	Disabled
X	High	Enabled
1	X	Enabled

X = Don't care.

Figure 8. Equivalent C/Q Logic

**Table 5. C/Q Driver Output State**

TXC AND TXQ (SEE NOTE)	Q	C/Q_PP	C/Q_N/P	C/Q CONFIGURATION	C/Q STATE
High	1	0	0	PNP, open drain	On, C/Q is high
High	0	0	0	PNP, open drain	Off, C/Q is high impedance
High	1	0	1	NPN, open drain	Off, C/Q is high impedance
High	0	0	1	NPN, open drain	On, C/Q is low
High	1	1	X	Push-pull	High
High	0	1	X	Push-pull	Low

**Note:** TXC and TXQ =  $V_L$ .

X = Don't care.

## IO-Link Device Transceiver

### DIOConfig Register [R1, R0] = [1,0]

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Bit Name	DoInv	DoAv	DoN/P	DoPP	DoEn	DoBit	LiDis	DiLoad
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
POR State	0	0	0	0	0	0	0	0

Use the DIOConfig register to control the DI and DO interfaces. All bits in the DIOConfig register are read-write and are set to 0 at power-up.

BIT	NAME	DESCRIPTION
D7	DoInv	<b>DO Output Polarity.</b> Set the DoInv bit to 1 to invert the logic of the DO output. This bit also works in conjunction with the DoAv (Table 6). DO tracks the TXC and TXQ inputs with the opposite polarity when both the DoAv and DoInv bits are set.
D6	DoAv	<b>DO Antivalent Operation.</b> Set the DoAv bit to 1 to enable antivalent output operation on DO. DO tracks the TXC and TXQ inputs (and the Q bit) when DoAv is 1 (Table 6). The LO input and the DoBit are ignored when the DoAv bit is 1.
D5	DoN/P	<b>DO Driver NPN/PNP Operation.</b> The DoN/P bit selects between low-side (NPN) and high-side (PNP) modes when the DO driver is configured as an open-drain output (DoPP = 0). Set DoN/P to 1 to configure the driver for low-side (NPN) operation. Set DoN/P to 0 for high-side (PNP) operation.
D4	DoPP	<b>DO Driver Push-Pull Operation.</b> Set the DoPP bit to 1 to configure the DO driver output for push-pull operation. DO is an open-drain output when DoPP is 0.
D3	DoEn	<b>DO Driver Enable/Disable.</b> Set the DoEn bit to 1 to enable the DO driver. The DO driver is high impedance with a weak pulldown when DoEn is 0.
D2	DoBit	<b>DO Driver Output Logic.</b> The DoBit bit can be used to program the DO output driver through software. Drive LO high to activate DoBit programming (Figure 9). The DO output state is given in Table 7. Note that Table 7 assumes that the DoInv bit is 0.
D1	LiDis	<b>LI Output Enable/Disable.</b> Set the LiDis bit to 1 to disable the LI output. The LI output is low when LiDis is 1.
D0	DiLoad	<b>DI Current Sink Enable.</b> Set the DiLoad bit to 1 to enable the internal current sink at the DI input.

## IO-Link Device Transceiver

**Table 6. DoAv and DoInv Operation**

DoAv	DoInv	TXC AND TXQ (NOTE 1)	LO (NOTE 1)	DO (NOTE 2)	C/Q (NOTE 2)
0	0	Low	Low	High	High
0	0	Low	High	Low	High
0	0	High	Low	High	Low
0	0	High	High	Low	Low
0	1	Low	Low	Low	High
0	1	Low	High	High	High
0	1	High	Low	Low	Low
0	1	High	High	High	Low
1	0	Low	Low	Low	High
1	0	Low	High	Low	High
1	0	High	Low	High	Low

## IO-Link Device Transceiver

### Mode Register [R1, R0] = [1,1]

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Bit Name	RST	WulntEn	DoFault	C/QFault	UV24	OTemp	UV33En	LDO33Dis
Read/Write	R/W	R/W	R	R	R	R	R	R/W
POR State	0	0	0	0	0	0	0	0

Use the Mode register to reset the MAX14820 and manage the 3.3V LDO. The Mode register has bits that represent the current status of fault conditions. When writing to the Mode register, the contents of the fault indication bits (bits 2 to 5) do not change.

BIT	NAME	DESCRIPTION
D7	RST	<p><b>Register Reset.</b> Set RST to 1 to reset all registers to their default power-up state. Then set RST to 0 for normal operation.</p> <p>The Status register is cleared and <math>\overline{\text{IRQ}}</math> deasserts (if asserted) when RST = 1. Interrupts are not generated while RST = 1.</p>
D6	WulntEn	<p><b>Wake-Up Interrupt Enable.</b> Set WulntEn to 1 to enable wake-up interrupt generation. When WulntEn is set, the Wulnt bit in the Status register is set and <math>\overline{\text{IRQ}}</math> asserts when a valid wake-up condition is detected. The C/Q driver must be enabled for wake-up detection. The state of WulntEn does not affect the <math>\overline{\text{WU}}</math> output. See the <i>Wake-Up Detection</i> section for more information.</p>
D5	DoFault	<p><b>DO Fault Status.</b> The DoFault bit is set when a short circuit or voltage fault occurs at the DO driver output (see the <i>DO Fault Detection</i> section for more information). The DoFault and DoFaultInt bits are both set when a fault occurs on DO. DoFault is cleared when the fault is removed.</p>
D4	C/QFault	<p><b>C/Q Fault Status.</b> The C/QFault bit is set when a short circuit or voltage fault occurs at the C/Q driver output (see the <i>C/Q Fault Detection</i> section for more information). The C/QFault and C/QFaultInt bits are both set when a fault occurs on C/Q. C/QFault is cleared when the fault is removed.</p>
D3	UV24	<p><b>V<sub>CC</sub> Undervoltage Condition.</b> Both the UV24 and the UV24Int bits are set when V<sub>CC</sub> falls below V<sub>CCUVLO</sub>. UV24 is cleared when V<sub>CC</sub> rises above the V<sub>CC</sub> threshold. V<sub>5</sub> must be present for V<sub>CC</sub> undervoltage monitoring.</p>
D2	OTemp	<p><b>Temperature Warning.</b> The OTemp bit is set when a high-temperature condition occurs on the devices. Both the OTempInt interrupt in the Status register and the OTemp bit are set when the junction temperature of the die rises to above +115°C (typ). The OTemp bit is cleared when the junction temperature falls below +95°C (typ).</p>
D1	UV33En	<p><b>LDO33 UV Enable.</b> Set the UV33En bit to 1 to assert the UV output when LDO33 voltage falls below the 2.4V (typ) undervoltage lockout threshold. The UV33En bit does not affect the UV33Int bit in the Status register; <math>\overline{\text{IRQ}}</math> asserts when V<sub>LDO33</sub> falls below V<sub>LDO33UVLO</sub> regardless of the state of UV33En.</p>
D0	LDO33Dis	<p><b>LDO33 Enable/Disable.</b> Set LDO33Dis to 1 to disable the 3.3V linear regulator (LDO33).</p>

## IO-Link Device Transceiver

### SPI Interface

The device communicates through an SPI-compatible 4-wire serial interface. The interface has three inputs—clock (SCLK), chip select ( $\overline{CS}$ ), and data in (SDI)—and one output, data out (SDO). The maximum SPI clock rate

for the device is 12MHz. The SPI interface complies with clock polarity CPOL = 0 and clock phase CPHA = 0 (see [Figure 10](#) and [Figure 11](#)).

The SPI interface is not available when  $V_5$  or  $V_L$  are not present.

Figure 10. SPI Write Cycle

Figure 11. SPI Read Cycle

## IO-Link Device Transceiver

### Applications Information

#### UART Interfacing

The logic levels of the microcontroller interface I/Os (TXC, TXQ, TXEN, and RX) are defined by  $V_L$ .

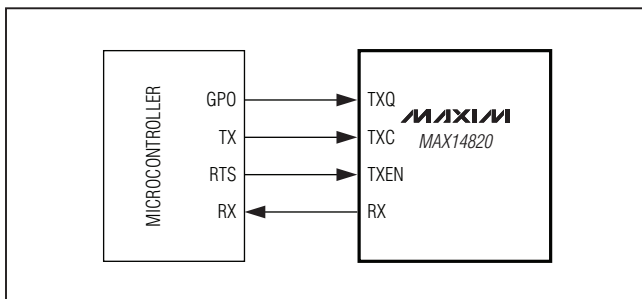

Figure 12. UART Interface

Figure 13. MAX14820 Operating Circuit with TVS Protection

The device can be interfaced to microcontrollers where the on-board UART TX output cannot be programmed as a logic output (GPO). In this case, connect the TX output of the UART to the TXC input for IO-Link communication and connect a separate GPO output on the microcontroller to TXQ for standard IO (SIO) mode operation (Figure 12). As the TXQ and TXC inputs are internally logically ANDed, the unused input (TXC or TXQ) must be held high while the other is in operation.

#### Transient Protection

Inductive load switching, surges, and bursts create high transient voltages. C/Q, DO, and DI should be protected against high overvoltage and undervoltage transients. Positive voltage transients on C/Q, DO, and DI must be limited to +55V relative to GND and negative voltage transients must be limited to -55V (relative to  $V_{CC}$ ) on DO and C/Q and to -55V (relative to GND) on DI. Figure 12 shows suitable protection using TVS diodes to meet both the IEC 61000-4-2 ESD and IEC 61000-4-5 surge testing. Other protection schemes may also be suitable.

To protect against large transients at  $V_{CC}$ , insert a lowpass filter on  $V_{CC}$  (see Figure 13 and the [Typical Operating Circuit](#)).

#### External Power

The device is powered by  $V_{CC}$  and the 5V regulator,  $V_5$ .  $V_L$  is a reference voltage input to set the logic levels of the microcontroller interface. The logic and SPI interface are operational when  $V_5$  and  $V_L$  are present even if  $V_{CC}$  is not present.

The  $V_P$  output provides a reverse-polarity-protected voltage one diode drop below  $V_{CC}$  and can be used for supplying external circuitry, like power supplies.

Connect LDOIN to  $V_5$  to power the  $V_5$  input with an external supply (Figure 14). This configuration disables operation of the internal 5V regulator and reduces power consumption.

**IO-Link Device Transceiver****Revision History**

0	3/11	Initial release	—
1	4/11	Corrected DO current level, corrected formatting and typos, added test condition to 2 <i>Typical Operating Characteristics</i> graphs, and added information to <i>Pin Description</i> .	1, 11, 13, 14, 15, 18, 23, 25, 27
2	6/11	Changed DI input threshold high and DI input threshold low max ratings; changed $V_{DI}$ specifications in Table 2; changed <i>Pin Description</i> for I.C. pin.	1, 4, 13, 17, 20
3	8/11	Corrected C/Q and DO minimum and maximum ratings in the <i>Absolute Maximum Ratings</i> section. Corrected $I_{CC}$ maximum value and shuffled row parameters in the <i>Electrical Characteristics</i> Table. Replaced Figures 10 and 11. Added Maxim part number for DC-DC regulator.	3, 26
4	1/12	Corrected Typical Operating Circuit, IEC number, <i>Short-Circuit Timing Diagram</i> ; added new TOC 17 and updated Figure 11	1, 13, 26, 27, 28

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
