DESCRIPTION

The SY10/100EP11U is a precision, high-speed 1:2 differential fanout buffer. Having within-device skews and output transition times significantly improved over the EL11V, the EP11U is ideally suited for those applications which require the ultimate in AC performance.

The differential inputs of the EP11U employ clamping circuitry to maintain stability under open input conditions. If the inputs are left open, the Q outputs will go LOW.

PIN NAMES

Pin	Function
D	PECL, LVPECL, ECL, LVECL Clock or Data Input: Internal 75kΩ pull-down resistor. If left floating, pin defaults LOW, Q _{OUT} goes LOW.
/D	PECL, LVPECL, ECL, LVECL complementary Clock or Data Input: Internal 75kΩ pull-up and down resistors. If left open, default is $V_{CC}/2$. When the input is not used, it can be left open.
Q0, /Q0 Q1, /Q1	PECL, LVPECL, ECL, LVECL Outputs: Terminates to $V_{CC} - 2V$.
V _{CC}	Positive Power Supply: Bypass with 0.1μF//0.01μF low ESR capacitors.
V _{EE}	Negative Power Supply: For PECL operation, connect to GND.
