### SPINDLE MOTOR AND 5CH ACTUATOR DRIVER

#### <FEATURES>

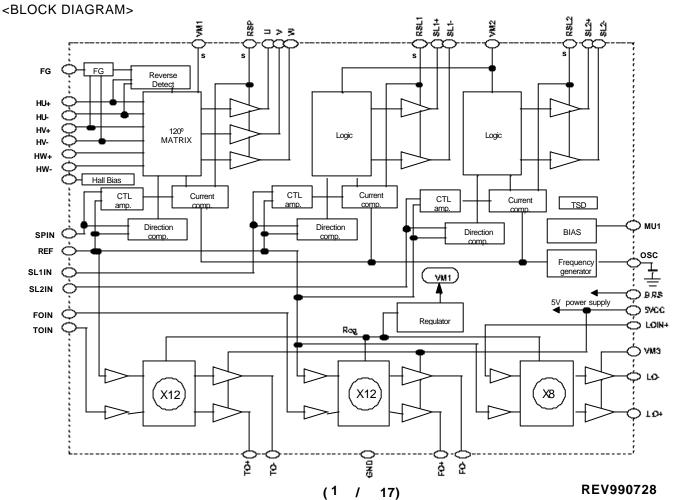

This IC is 1 chip driver IC for spindle motor and 5 channel actuators. All of the motor and actuator of optical disk drive system (CD-ROM etc.) can be drived by only this IC. This IC has a direct PWM control system for Spindle and Slide channels drive due to reducing IC power dissipation. This IC has three voltage supply terminals (for Spindle, Slide, Focus/Tracking and Loading), and three voltage supply can be set separately.

Further more this IC has short braking select function,FG amplifier, thermal shut down circuit, standby circuit, reverse rotation detect circuit.

### <APPLICATION>

CD-ROM, DVD, DVD-ROM, DVD-RAM ,Optical disc related system,etc

### <PIN FUNCTION>

#### \*note2

The spindle output terminal is needed external shottky diode between each output and GND when it is used above 0.6A. Discription(IoA) is case of with external shottky diode.

# SPINDLE MOTOR AND 5CH ACTUATOR DRIVER

### <THERMAL DERATING >

This IC's package is POWER-SSOP, so improving the board on which the IC is mounted enables a large power dissipation without a heat sink.

For example, using an 1 layer glass epoxy resin board, the IC's power dissipation is 2.6W at least. And it comes to 3.6W by using an improved 2 layer board.

The information of the N, P type board is shown in attached.

### <THERMAL CHARACTERISTICS>

		FUNCTION S	START TEMPER	RATURE OF IC	FUNCTION	STOP TEMPER	ATURE OF IC	
SYMBOL	PARAMETER	MIN	TYP	MAX	MIN	TYP	MAX	Unit
TSD	Thermal Shut Down		160			130		°C

<sup>\*</sup>note3

This TSD function start temperature doesn't show the guaranteed max. temperature of the devices.

The guranteed max. temperature is Tj max. which is shown in "9. ABSOLUTE MAXIMUM RATING". The TSD function is a thermal protection in case the temperature of the devices goes up above Tjmax because of wrong use.

And these TSD temperature are the target temperatures for circuit design, not the guranteed temperatures.

(The TSD function of all the devices is not checked by a test in high temperature.)

# SPINDLE MOTOR AND 5CH ACTUATOR DRIVER

### Standby function

Logic	control			Drive	channel		
	MU1	Loading	Slide1	Slide2	Focus	Tracking	Spindle
SELECT2	Н	On	On	On	On	On	On
SERECT1	L/Open	Off	Off	Off	Off	Off	Off

This IC has MUTE terminal (MU1).

It is possible to control ON / OFF of the channel by external logic inputs.

In case of SELECT1, the bias of all circuit becomes OFF.

Therefore, this mode is available in order to reduce the power dissipation when the waiting mode.

In case of SELECT2, the bias of all channel becomes ON.

#### Brake select function

BRS	SPIN < REF	REF < SPIN
Hi	Reverse brake	Forward
L/OPEN	Short Brake	Forward

This IC has BRS terminal (BRS).

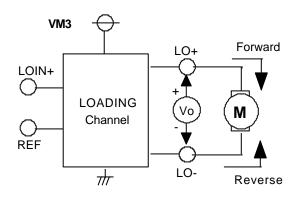

It is possible for a braking timiming of Spindle drive to select which the short brake or the reverse brake by BRS. It shuould select the short brake in case of high speed system and please change to the reverse brake when the rotation speed becomes enough low. It is available when the SPIN voltage is low than the reference voltage.

#### Loading channel

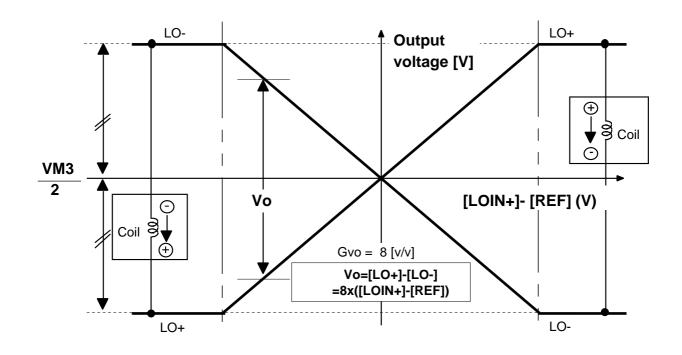

The loading channel is the circuit of BTL voltage drive. This circuit has the referential input. Output swing is determined with  $\Delta \, \text{Vin X 8}.$  Also,it is possible for this channel to use for the slide motor , the focus coil and the tracking coil.

The input terminal is high impedance. It is possible to do variable a gain by external resistor.

In case of one MCU port, if use three state port, it is possible for this channel to have the stop function.

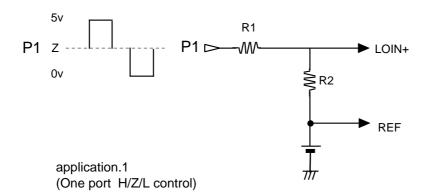

# SPINDLE MOTOR AND 5CH ACTUATOR DRIVER

application.1 (One port H/Z/L control)

Logic control P1	Situation of loading channel	Output voltage swing
5v	Forward rotation	Vo = 8x(5[V]-REF[V]) xR2/(R1+R2)
Z (Hi impedance)	Short brake> Stop	Vo=0 [V]
0	Reverse rotation	$Vo = \frac{-8x(5[V]-REF[V])}{xR2/(R1+R2)}$

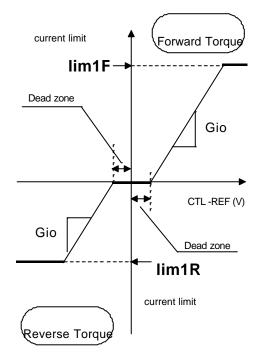

# SPINDLE MOTOR AND 5CH ACTUATOR DRIVER

#### SPINDLE channel

The relationship between the differential voltage between SPIN and REF and the torque is shown in right Figure. The voltage gain[Gvo] is 1.0 [V/V]. The current gain[Gio] is 2.0[A/V] (at sensing resistor : 0.5 ohm,and R1= $\infty$ ,R2=0ohm) in forward torque directions, and the dead zone is from 0mV to 80mV (at R1= $\infty$ ,R2=0ohm) .

The coil current gain under the reverse torque is the same with in forward torque directions. And the limitation function gets on when the differential voltage of VM1(12V)~RSP is 0.5V.

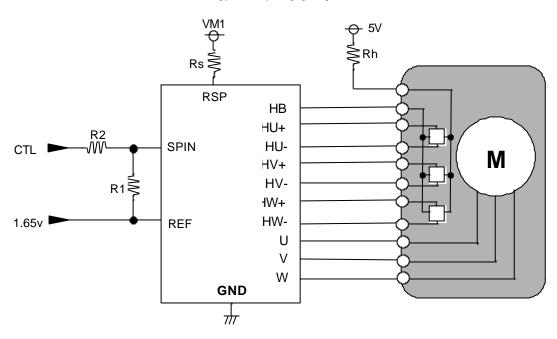

Therefore current-gain-control and current-limit of this IC is determined with sensing resister value, and more detail control can be determined with setting a gain-resister outer this IC as below.

The example of current-gain and current-limit of SPINDLE.

	   Ilim1F   Ilim1		Gio* [A/V]			
Rs [Ω]	[A]	[A]	R1=∞ R2=0 ohm	R1=R2	R1=2•R2	
0.50	1.00	0.56	2.00	1.00	0.66	
0.75	0.66	0.37	1.33	0.66	0.44	
1.00	0.50	0.28	1.00	0.50	0.33	

 $Gio^* = R1 / [(R1+R2) \cdot Rs] [A/V]$ 

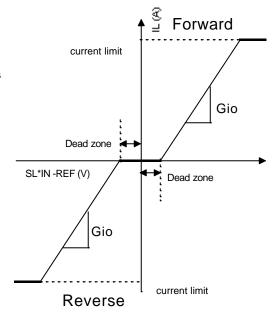

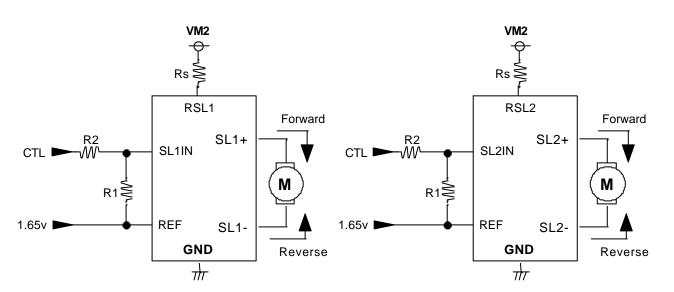

### SLIDE channel

The relationship between the differential voltage between SLIN and REF and the torque is shown in right Figure. The voltage gain[Gvo] is 1.0 [V/V]. The current gain is 2.0[A/V] (at sensing resistor : 0.5 ohm and  $R1=\infty,R2=0$ ohm) in forward torque directions, and the dead zone is from 0mV to 80mV (at  $R1=\infty,R2=0$ ohm)).

The coil current gain under the reverse torque is the same with in forward torque directions. And the limitation function gets on when the differential voltage of VM2(12V)~RSL is 0.5V.

Therefore current-gain-control and current-limit of this IC is determined with sensing resister value.

The example of current-gain and current-limit of SLIDE.

		Gio* [A/V]			
Rs [Ω]	Ilim [A]	R1=∞ R2=0 ohm	R1=R2	R1=2•R2	
0.50	1.00	2.00	1.00	0.66	
0.75	0.66 1.33		0.66	0.44	
1.00	0.50	1.00	0.50	0.33	

Gio\*= R1 / [(R1+R2)•Rs] [A/V]

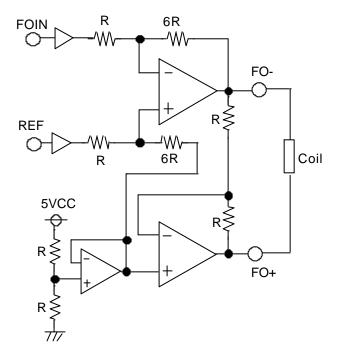

### FOCUS / TRACKING channel

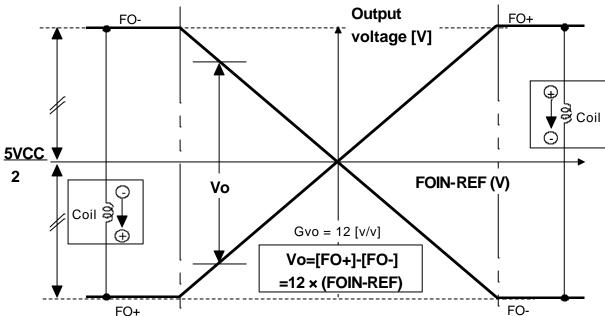

The focus and tracking channel is the voltage control drive using BTL .

The focus and tracking is the same composition.

The relationship between the differential voltage between FOIN and REF and the output voltage is shown in below Figure.

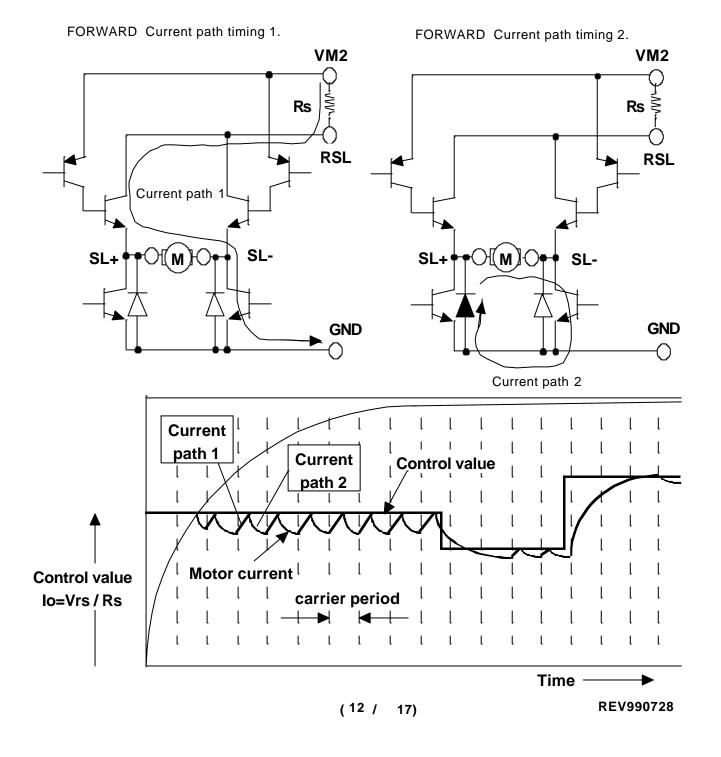

The voltage gain [Gvo] is 5.0 [V/V].

### **Direct PWM operation**

The spindle and the slide channel is controlled by the direct PWM control. Also, built-in the current limit circuit. This IC controls the motor current directly.

# M63021FP

# SPINDLE MOTOR AND 5CH ACTUATOR DRIVER

### PWM carrier frequency setting

PWM carrier frequency is decided by charging and discharging the capacitor that is connected to OSC terminal outer IC. Examination of the relationship the capacitor connected to OSC terminal and PWM carrier frequency is given in following table.

Capacitor [pF]	820	750	330	220	180	130	110
Carrier Frequency [KHz]	28	30	65	90	110	140	160

<sup>\*</sup>note) This PWM carrier frequency is TYP value.

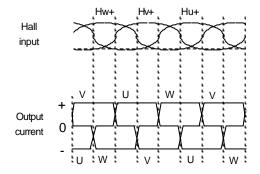

#### Recommendation of SHORT BRAKE MODE at SPINDLE DRIVE

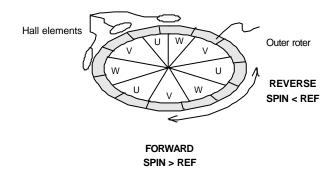

This IC has two brake mode, PWM-BRAKE-MODE and SHORT-BRAKE-MODE. In this IC recommendation, SHORT-BRAKE-MODE is superior to PWM-BRAKE-MODE to reducing the power dissipation and to avoid braking down of this IC.

(By excessive reverse torque current in braking a motor with PWM-BRAKE from high-speed-rotation with being excessive Back-EMF, this IC could be broken.)

The relationship between hall-amplifier-input and output-current-commutation at SPINDLE DRIVE

The relationship between the hall elements and the motor output current is shown in bellow Figure.

### FG function at SPINDLE DRIVE

The FG terminal outputs the square pulse signal synchronizing with the Hall inputs [Hv+, Hv-] timing. And, the FG terminal is open-collector output.

### Phase delay circuit at SLIDE

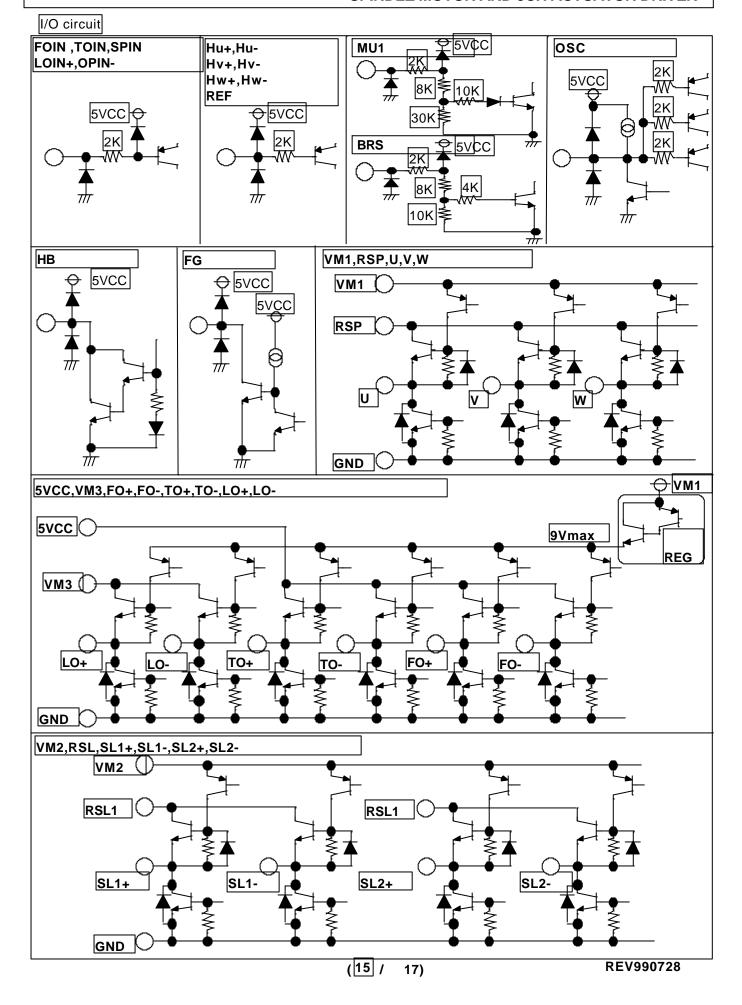

Phase delay circuit is built in the IC to detect an output spike current, when the motor current direction is switching.

In switching the motor current direction, Phase delay circuit switch-off all output trangister of H-bridge for 3µsec.

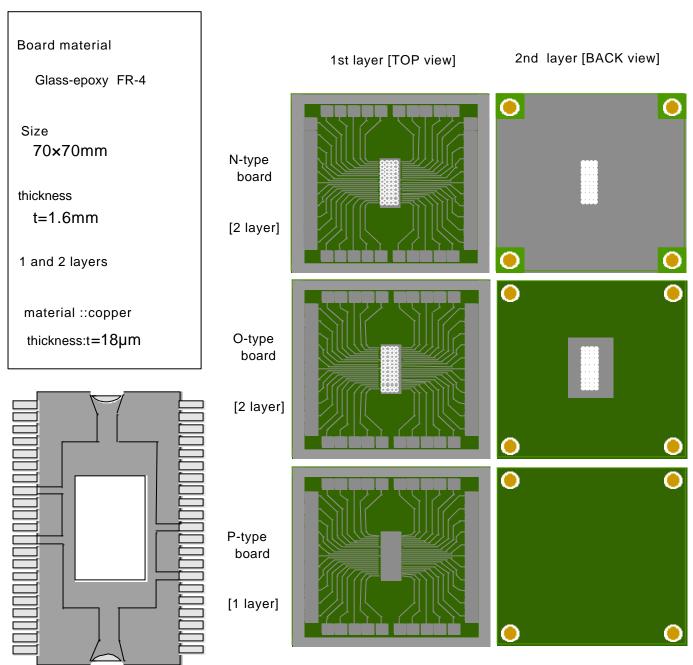

### Output current setting at SLIDE

In this IC, since output tranjister is NPN-type tranjister, motor coil current (Io) is larger than sensing resistance current about 10mA (TYP.) according to base current of output tranjister. Therefore please design output current with consisting these base current.
