16-bit Buffer / Driver with 3-state Outputs

HITACHI

ADE-205-206 (Z)
Preliminary
1st. Edition
January 1998

Description

This 16-bit buffer / driver is designed for 2.3 V to 3.6 V V_{CC} operation.

The HD74ALVC16244 is designed specifically to improve the performance and density of 3-state memory address drivers, clock drivers, and bus oriented receivers and transmitters. The device can be used as four 4-bit buffers, two 8-bit buffers, or one 16-bit buffer. It provides true outputs and symmetrical active-low output-enable ($\overline{OE}$) inputs.

To ensure the high impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current sinking capability of the driver.

Features

- $V_{CC} = 2.3 \text{ V to } 3.6 \text{ V}$
- Typical V_{OL} ground bounce $< 0.8 \text{ V}$ ($@V_{CC} = 3.3 \text{ V}$, $T_a = 25^\circ\text{C}$)
- Typical V_{OH} undershoot $> 2.0 \text{ V}$ ($@V_{CC} = 3.3 \text{ V}$, $T_a = 25^\circ\text{C}$)
- High output current $\pm 24 \text{ mA}$ ($@V_{CC} = 3.0 \text{ V}$)

Notes: Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

- 1. The input and output negative voltage ratings may be exceeded if the input and output clamp current ratings are observed.
- 2. This value is limited to 4.6 V maximum.
- 3. The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 750 mils.
