An ON Semiconductor Company

LV5029MD

Bi-CMOS IC
LED Driver IC for LED Lighting
Overview

LV5029MD is a High voltage LED drive controller which drives LED current with external MOSFET.

LV5029MD is realized very simple LED circuits with a few external parts. It corresponds to active power factor corrector control.

Note) This LV5029MD is designed or developed for general use or consumer appliance. Therefore, it is NOT permitted to use for automotive, communication, office equipment, and industrial equipment.

Functions

- High voltage LED controller
- Various Dimming Control
 - Analog Input & PWM Input
- Selectable Switching frequency
[50 kHz or 70 kHz, open: 50 kHz]
- Built-in overvoltage detection of CS pin.
- Built-in active power factor corrector.
- Short protection circuit
- Selectable reference Voltage
 - Internal 0.605V & External Input Voltage
- Low noise switching system/skip frequency function
 - 5 stages skip mode Frequency
 - Soft driving

Specifications
Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum input voltage	V _{IN} max (Note1)		-0.3 to 42	V
REF_OUT, REF_IN, RT, CS, PWM_D			-0.3 to 7	V
OUT pin	V _{OUT-abs}		-0.3 to 42	V
Allowable power dissipation	Pd max	With specified board*	1.0	W

- Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment. The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for new introduction or other application different from current conditions on the usage of automotive device, communication device, office equipment, industrial equipment etc. , please consult with us about usage condition (temperature, operation time etc.) prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.
- Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Pin Functions

Pin No.	Pin name	Pin function	Equivalent circuit
1	RT	Switching frequency selection pin. L or Open : 50kHz switching, H: 70 kHz switching. In case of 70kHz, connect to RT pin to REFOUT pin. on time	
2	REF_OUT	Built-in 3V Regulate out Pin. If this function isn't used, please connect to nothing.	
3	REF_IN	External LED current Limit Setting pin. If less than VREF (0.61V) voltage is input, Peak current value is used at the input voltage. If more than REF_IN voltage is input, it is done at VREF voltage. If this function isn't used, please connect nothing.	
4	CS	LED current sensing in. If this terminal voltage exceeds VREF (Or REF_IN), external FET is OFF. And if the voltage of the terminal exceeds 1.9V, LV5029MD turns to latch-off mod	
5	PWM_D	PWM Dimming pin. L or open: normal operation, H: Stop operation.	
6	GND	GND pin.	
7	OUT	Driving the external FET Gate Pin.	
8	V _{IN}	Power supply pin. Operation : V _{IN} > UVLOON Stop: V _{IN} < UVLOOFF Switching Stop : V _{IN} > V _{IN} OVP	
9	NC	Connect to nothing	
10	GND	GND pin.	

LED current and inductance setting

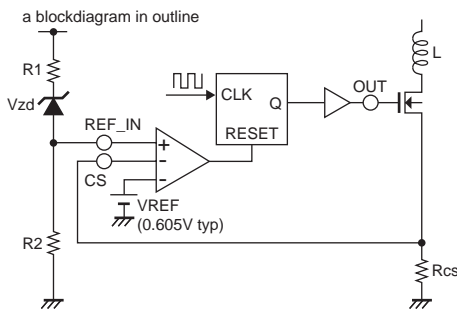

• Relation ship between REF_IN and CS pin voltage (Power Factor Correction (PFC))

The output current value is the average of the current value that flows during one cycle. The current value that flows into coil is a triangular wave shown in the figure below. Make sure to set I_{pk} so that (average of current value at one cycle) is equal to (LED current value). I_{pk} is set by the relationship between REF_IN voltage and R_{cs} voltage. This relationship make Power Factor Correction (PFC). Therefore, it is available to make LED current a sine curve.

• Setting Zener voltage

V_{zd} depend on LED voltage (V_f). Choose Zener diode around V_f (LED voltage). When VAC voltage is lower than V_f , LED operation is not normal. Using Zener diode prevents incorrect operating during VAC voltage lower than V_f . In detail, refer to [LED current and inductance setting]

In case of REF_IN pin open, this error amplifier negative input(-) is under control of internal VREF voltage (0.605V typ).

$$I_{pk} = \frac{(V_{ac} - V_{zd}) \times \frac{R_2}{R_1 + R_2}}{R_{cs}}$$

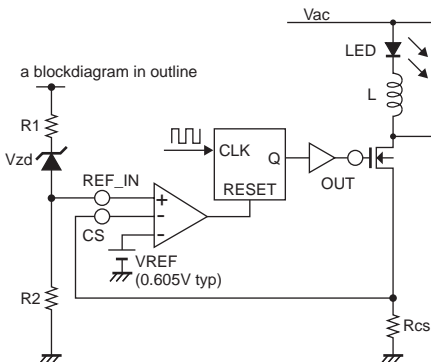

- I_{pk} : peak inductor current
- V_f : LED forward voltage drop
- V_{ac} : effective value, R.M.S value
- V_{REF} : Built-in reference voltage (0.605V)
- V_{REF_IN} : REF_IN voltage (6 pin)
- R_s : External sense resistor
- V_{zd} : Zener diode voltage (REF_IN pin)

LED current and inductance setting

It is available to use both no-isolation and isolation applications.

(For non-isolation application)

The output current value is the average of the current value that flows during one cycle. The current value that flows into coil is a triangular wave shown in the figure below. Make sure to set I_{L_PK} so that (average of current value at one cycle) is equal to (LED current value).

$$I_{pk} = \frac{(V_{ac} - V_f) \times L \times T_c}{T_d} = V_f / L \times T_d$$

LV5029MD

Given that the period when current flows into coil is

$$\text{DutyI} = \frac{T_c + T_d}{T}$$

$$I_{pk} \times \frac{1}{2} \times (\text{Duty} \times T) / T = I_{LED}$$

$$I_{pk} \times \frac{2 \times I_{LED}}{\text{DutyI}} \quad (1) \quad \text{since} \quad I_{pk} \times \frac{V_{REF_IN}}{R_{cs}}$$

$$R_{cs} \times \frac{V_{FEF_IN}}{I_{pk}} = \frac{\text{DutyI} \times V_{FEF_IN}}{2I_{LED}} \quad (2)$$

I_{pk} : peak inductor current
 V_f : LED forward voltage drop
 V_{ac} : effective value(R.M.S value)
 V_{REF} : Built-in reference voltage (0.605V)
 V_{REF_IN} : REF_IN voltage (6 pin)
 R_s : External sense resistor
 V_{zd} : Zener diode voltage (REF_IN pin)

Since formula for LED current is different between on period and off period as shown above,

$$I_{pk} \times \frac{V_{ac} - V_f}{L} \times T_c = \frac{V_f}{L} \times T_d \quad (3)$$

$$\text{Since } T_c + T_d = \text{DutyI} \times T, T_c = \text{DutyI} \times T - T_d \quad (4)$$

$$\text{Based on the result of (3) and (4), } T_d = \text{DutyI} \times T \times \frac{V_{ac} - V_f}{V_{ac}} \quad (5)$$

To obtain L from the equation (1), (3), (5),

$$L \times \frac{V_f \times \text{DutyI}}{2 \times I_{LED}} \times \text{DutyI} \times T = \frac{V_{ac} - V_f}{V_{ac}} = \frac{V_f}{2 \times I_{LED}} \times \frac{1}{f_{osc}} \times \frac{V_{ac} - V_f}{V_{ac}} \times (\text{DutyI})^2 \quad (6)$$

Since LED and inductor are connected in serial in non-isolation mode, LED current flows only when AC voltage exceed V_f .

Given that the ratio of inductor current to AC input is DutyAC.

$$\text{DutyAC} = \frac{90 - \arcsin\left(\frac{V_f}{\sqrt{2}V_{rms}}\right)}{90}$$

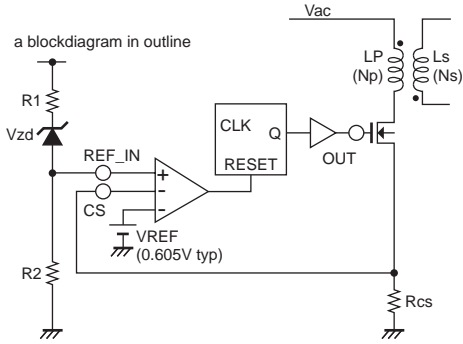

Since the period when the inductor current flows are limited by DutyAC, the formula (6) is represented as follows:

$$L = \frac{V_f}{2 \times I_{LED}} \times \frac{1}{f_{osc}} \times \frac{V_{ac} - V_f}{V_{ac}} \times (\text{DutyI})^2 \times \left(\frac{90 - \arcsin\left(\frac{V_f}{\sqrt{2}V_{rms}}\right)}{90} \right)^2 \quad (7)$$

LV5029MD

(for Isolation circuit)

Using the circuit diagram below, the wave form of the current that flows to Np and Ns is as follows.
Current waveform flows to primary side and secondary.

[Inductance L_p of primary side and sense resistor R_s]

If a peak current flow to transformer is represented as I_{pk_p} , the power (P_{in}) charged to the transformer on primary side can be represented as:

$$P_{in} = \frac{1}{2} \times L_p \times (I_{pk_p})^2 \times f_{osc} \quad (11)$$

$$I_{pk_p} = \frac{V_{ac}}{L_p} \times T_{on_p} \quad (12)$$

$$L_p = \frac{V_{ac}^2 \times T_{on_p}^2 \times f_{osc}}{2 \times P_{in}} = \frac{V_{ac}^2 \times D_{on_p}^2}{2 \times P_{in} \times f_{osc}} \quad (13)$$

$$(D_{on_p} = \frac{T_{on_p}}{T} = T_{on_p} \times f_{osc}),$$

To substitute the following to the formula below,

$$\therefore \eta = \frac{P_{out}}{P_{in}} \quad (14)$$

$$\therefore L_p = \frac{V_{ac}^2 \times T_{on_p}^2 \times f_{osc} \times \eta}{2 \times P_{out}} = \frac{V_{ac}^2 \times D_{on}^2 \times \eta}{2 \times P_{out} \times f_{osc}} \quad (15)$$

Sense resistor is obtained as follows.

$$R_s = \frac{V_{REF_IN}}{I_{pk_p}} = \frac{V_{REF_IN} \times L_p}{Vac \times Ton_p} = \frac{V_{REF_IN} \times L_p}{Vac \times Don_p \times T} \quad (16)$$

[Inductance L_s of secondary side]

Since output current I_{out} is the average value of current flows to transformer of secondary side

$$I_{out} = I_{pk_s} \times \frac{Ton_s}{T} \times \frac{1}{2} = \frac{I_{pk_s} \times Don_s}{2} \quad (Don_s = \frac{Ton_s}{T} = Ton_s \times f_{osc}) \quad (17)$$

$$I_{pk_s} = \frac{V_{out}}{L_s} \times Ton_s = \frac{V_{out}}{L_s} = \frac{Don_s}{f_{osc}} \quad (18)$$

$$L_s = \frac{V_{out} \times T \times Don_s^2}{2 \times I_{out}} = \frac{V_{out} \times Don_s^2}{2 \times I_{out} \times f_{osc}} = \frac{V_{out}^2 \times Don_s^2}{2 \times P_{out} \times f_{osc}} \quad (19)$$

Calculation of the ratio of transformer coil on primary side and secondary side

Since ratio and inductance of transformer coil is

$$\frac{N_s}{N_p} = \frac{\sqrt{L_s}}{\sqrt{L_p}} \quad (20)$$

substituted equations (15), (19) for (20)

$$\therefore \frac{N_p}{N_s} = \frac{Vac}{V_{out}} \times \sqrt{\eta} \times \frac{Don_p}{Don_s} \quad (21)$$

Calculation of transformer coil on primary side and secondary side

$$N = \frac{Vac \times 10^8}{2 \times \Delta B \times Ae \times f_{osc}} \quad (22)$$

ΔB : variation range of core flux density [Gauss]

Ae : core section area [cm²]

To use Al (L value at 100T),

$$N = \sqrt{\frac{L}{Al}} \times 10^2 \quad (23)$$

L: inductance [μ H]

Al: L value at 100T [uH/N²]

lg (Air gap) is obtained as follows:

$$lg = \frac{\mu_r \mu_0 N^2 Ae 10^2}{L} \quad (24)$$

μ_r : relative magnetic permeability, $\mu_r = 1$

μ_0 : vacuum magnetic permeability $\mu_0 = 4\pi \times 10^{-7}$

N: turn count [T]

Ae : core section area [m²]

L: inductance [H]

LV5029MD

Description of operation

Protection function

	title	outline	monitor point	note
1	UVLO	Under voltage lock out	V_{IN} voltage	
2	OCP	Over current protection	CS voltage	available FET current
3	OVP	Over voltage protection	V_{IN} voltage	
4	OTP (TSD)	Over Temperature Protection (Thermal Shut Down)	PN Junction temperature	

1. UVLO (Under voltage lock out)

If V_{IN} voltage is 7.3V or lower, then UVLO operates and the IC stops. When UVLO operates, the power supply current of the IC is about 80 μ A or lower. If V_{IN} voltage is 9V or higher, then the IC starts switching operation.

2. OCP (Over current protection)

The CS pin senses the current through the MOS FET switch and the primary side of the transformer. This provides an additional level of protection in the event of a fault. If the voltage of the CS pin exceeds V_{CSOCP} (1.9V typ) (A), the internal comparator will detect the event and turn off the MOSFET. The peak switch current is calculated

$$I_o (\text{peak}) [A] = V_{SOCP} [V] / R_{\text{sense}} [\Omega]$$

The V_{IN} pin is pulled down to fixed level, keeping the controller latched off. The latch reset occurs when the user disconnects LED from VAC and lets the V_{IN} falls below the V_{IN} reset voltage, UVLOOFF (7.3V typ) (B). Then V_{IN} rise UVLOON (9V typ) (C), restart the switching.

3. OVP (Over voltage protection)

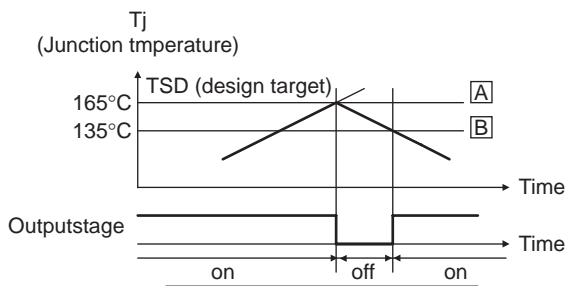

If the voltage of V_{IN} pin is higher than the internal reference voltage V_{INOVLP} (27V typ), switching operation is stopped.

The stopping operation is kept until the voltage of V_{IN} is lower than 7.3V. If the voltage of V_{IN} pin is higher than 9V, the switching operation is restated.

4. OTP (Over temperature protection)

The over temperature protection function works when the junction temperature of IC is 165°C (typ) (A), and the IC switching stops. The IC starts switching operation again when the junction temperature is 135°C typ (B) or lower.

Skip frequency function

LV5029MD contains the skip frequency function for reduction of the peak value of conduction noise. This function changes the frequency as follows.

Switching frequency is changed as follows.

... $\times 0.9 \rightarrow \times 1.1 \rightarrow \times 1.05 \rightarrow \times 1 \rightarrow \times 0.95 \rightarrow \times 0.9 \rightarrow \times 1.1$...

It's repeated by this loop.

LV5029MD

PWM dimming function

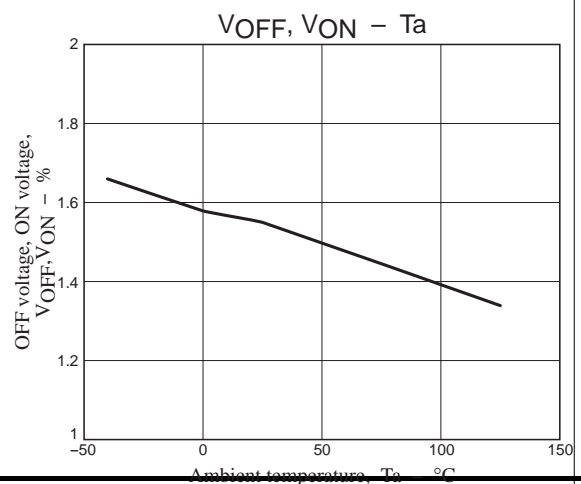

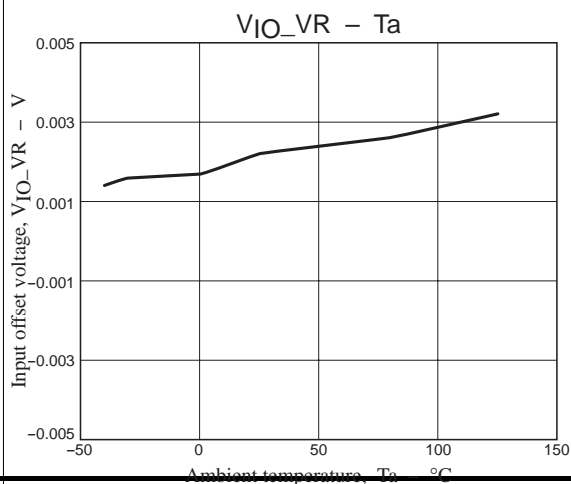

LED current can be adjusted according to Duty of PWM pulse input to PWM dimmer pin. PWM pulse is High (2V to 5V) then switching operation stops, and LED current stops flowing. PWM pulse is Low (under 0.6V), then switching operation stop is released, and it returns to normal operation. The OUTPUT FET is turned OFF within 100ns if PWM input turns into High when the OUTPUT FET is turned on.

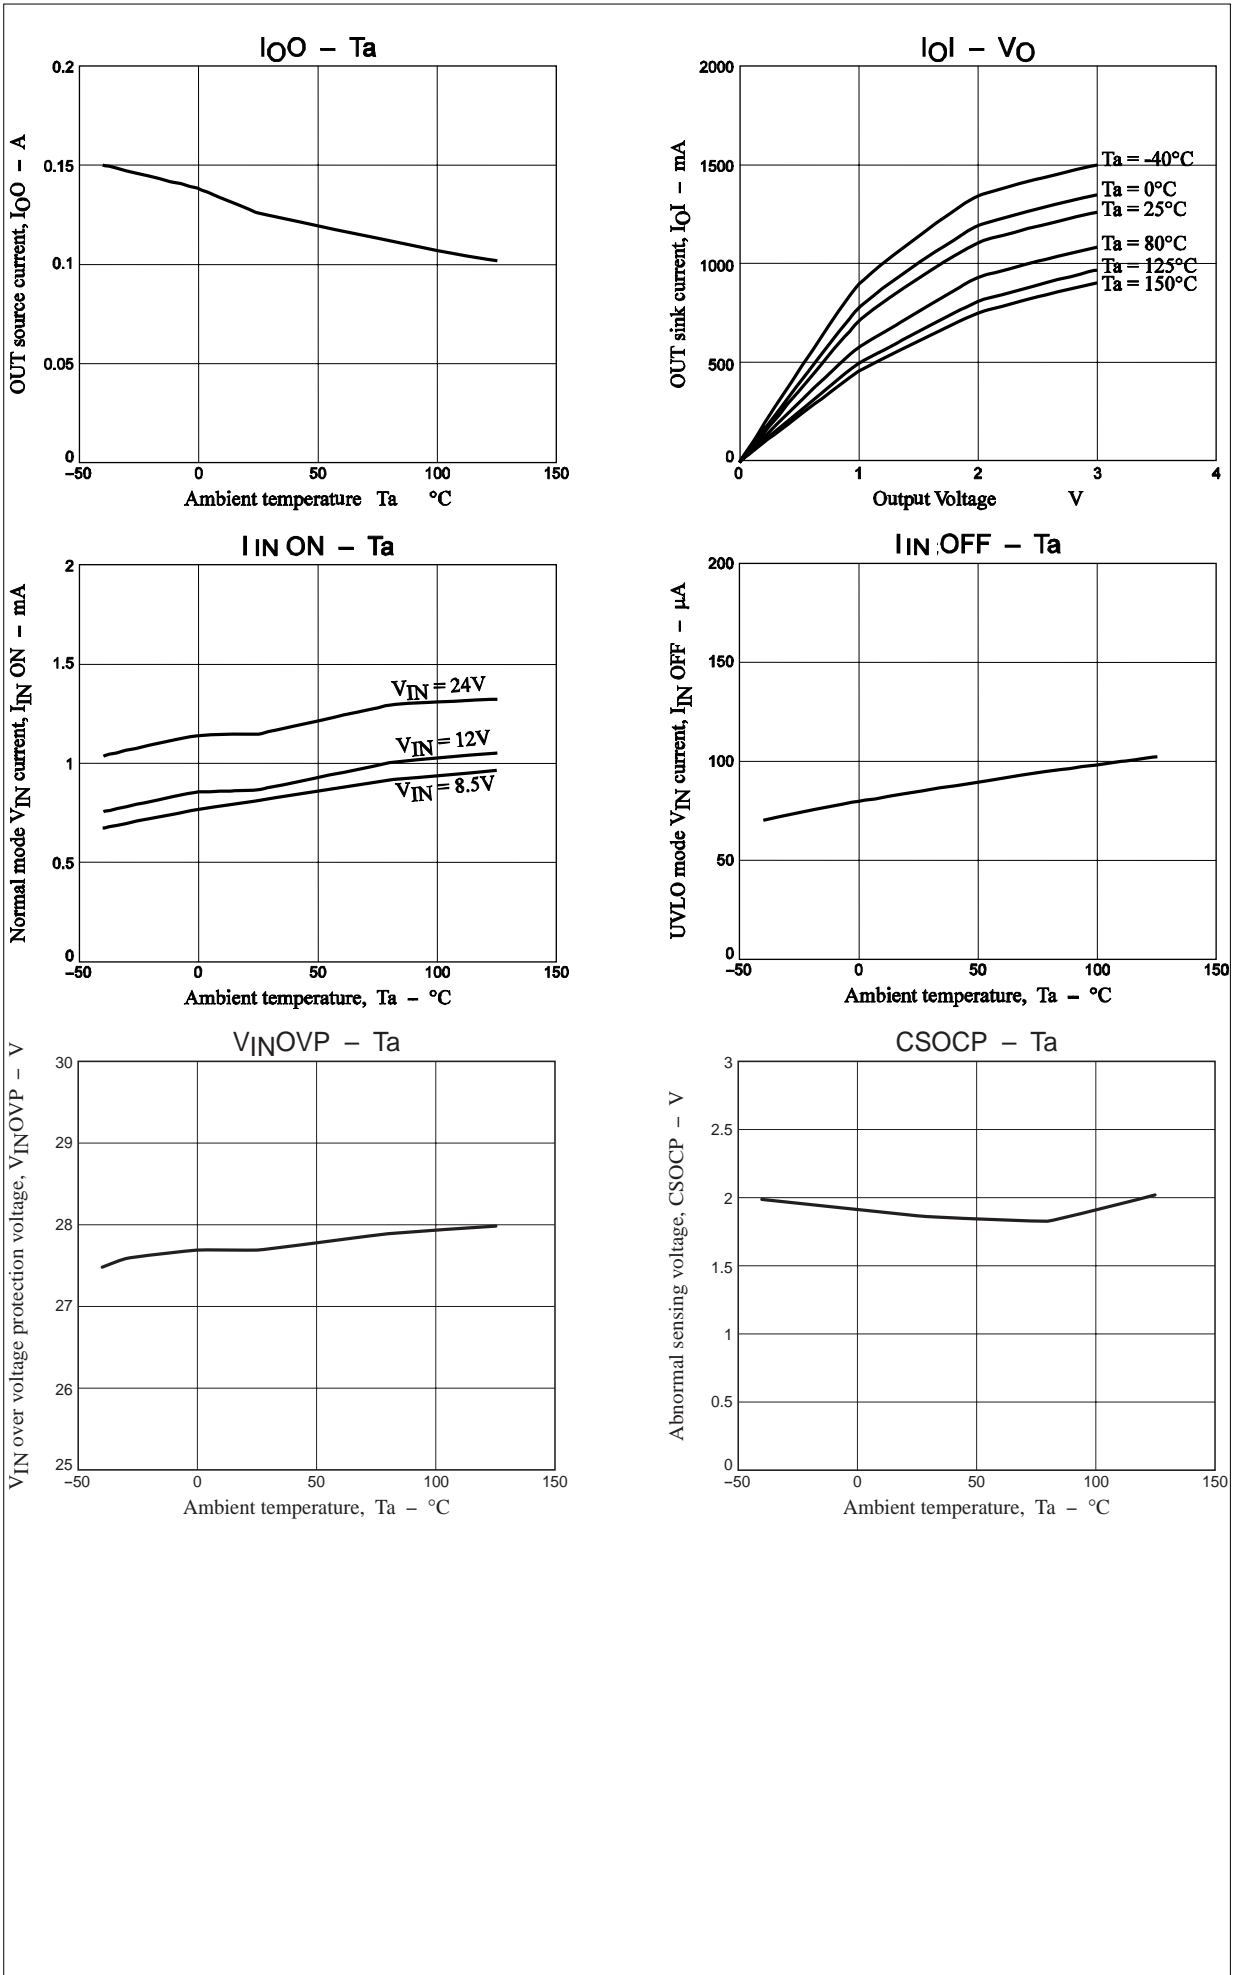

The recommended frequency of PWM dimming input is 100Hz (twice the AC voltage frequency) to 5 kHz. When frequency of the PWM is less than twice the AC frequency, a flicker becomes easy to be observed. On the other hand, if PWM frequency rise to around 50 kHz that is driving frequency of the switching of the OUTPUT FET, the flicker is easy to occur.

An outline of PWM_D pin

LED current vs PWM_D duty (outline)

- SANYO Semiconductor Co.,Ltd. assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein.
- Regarding monolithic semiconductors, if you should intend to use this IC continuously under high temperature, high current, high voltage, or drastic temperature change, even if it is used within the range of absolute maximum ratings or operating conditions, there is a possibility of decrease reliability. Please contact us for a confirmation.
- SANYO Semiconductor Co.,Ltd. strives to supply high-quality high-reliability products, however, any and all semiconductor products fail or malfunction with some probability. It is possible that these probabilistic failures or malfunction could give rise to accidents or events that could endanger human lives, trouble that could give rise to smoke or fire, or accidents that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
